PRECAUTIONS

ABS003611

ABS000R6

Precautions for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the SRS and SB section of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the SRS section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

Precautions for Battery Service

Before disconnecting the battery, lower both the driver and passenger windows. This will prevent any interference between the window edge and the vehicle when the door is opened/closed. During normal operation, the window slightly raises and lowers automatically to prevent any window to vehicle interference. The automatic window function will not work with the battery disconnected.

On Board Diagnostic (OBD) System of Engine and A/T

The ECM has an on board diagnostic system. It will light up the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

CAUTION:

- Be sure to turn the ignition switch OFF and disconnect the negative battery cable before any repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc. will cause the MIL to light up.
- Be sure to connect and lock the connectors securely after work. A loose (unlocked) connector will cause the MIL to light up due to the open circuit. (Be sure the connector is free from water, grease, dirt, bent terminals, etc.)
- Certain systems and components, especially those related to OBD, may use a new style slidelocking type harness connector. For description and how to disconnect, refer to <u>PG-65, "HAR-NESS CONNECTOR"</u>.
- Be sure to route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to light up due to the short circuit.
- Be sure to connect rubber tubes properly after work. A misconnected or disconnected rubber tube may cause the MIL to light up due to the malfunction of the EVAP system or fuel injection system, etc.
- Be sure to erase the unnecessary malfunction information (repairs completed) from the ECM and TCM (Transmission control module) before returning the vehicle to the customer.

Precaution

- Always use a 12 volt battery as power source.
- Do not attempt to disconnect battery cables while engine is running.
- Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect battery ground cable. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned OFF.
- Before removing parts, turn ignition switch OFF and then disconnect battery ground cable.
- Do not disassemble ECM.
- If a battery cable is disconnected, the memory will return to the ECM value.

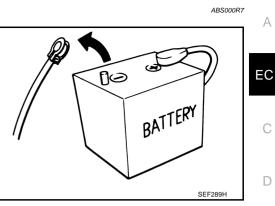

The ECM will now start to self-control at its initial value. Engine operation can vary slightly when the terminal is disconnected. However, this is not an indication of a malfunction. Do not replace parts because of a slight variation.

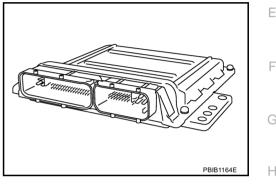

When connecting ECM harness connector, fasten it securely with a lever as far as it will go as shown in the figure.

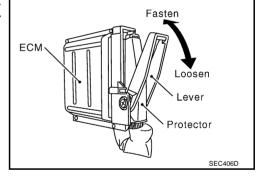

When connecting or disconnecting pin connectors into or from ECM, take care not to damage pin terminals (bend or break).

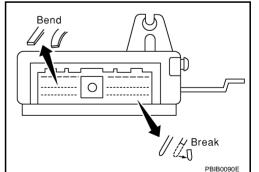

Make sure that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.

- Securely connect ECM harness connectors. A poor connection can cause an extremely high (surge) voltage to develop in coil and condenser, thus resulting in damage to ICs.
- Keep engine control system harness at least 10 cm (4 in) away from adjacent harness, to prevent engine control system malfunctions due to receiving external noise, degraded operation of ICs, etc.
- Keep engine control system parts and harness dry.

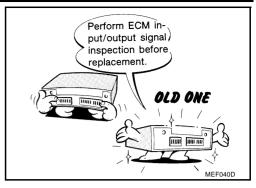

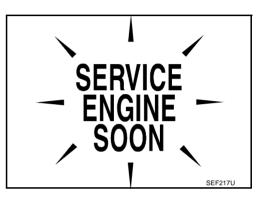

K

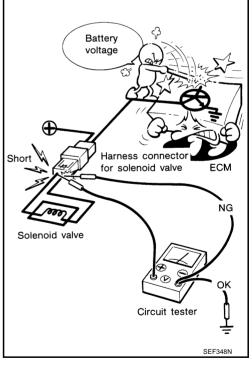

Μ

- Before replacing ECM, perform ECM Terminals and Reference Value inspection and make sure ECM functions properly. Refer to <u>EC-94</u>.
- Handle mass air flow sensor carefully to avoid damage.
- Do not disassemble mass air flow sensor.
- Do not clean mass air flow sensor with any type of detergent.
- Do not disassemble electric throttle control actuator.
- Even a slight leak in the air intake system can cause serious incidents.
- Do not shock or jar the camshaft position sensor (PHASE), crankshaft position sensor (POS).
- After performing each TROUBLE DIAGNOSIS, perform DTC Confirmation Procedure or Overall Function Check. The DTC should not be displayed in the DTC Confirmation Procedure if the repair is completed. The Overall Function Check should be a good result if the repair is completed.

- When measuring ECM signals with a circuit tester, never allow the two tester probes to contact. Accidental contact of probes will cause a short circuit and damage the ECM power transistor.
- Do not use ECM ground terminals when measuring input/ output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

PRECAUTIONS

B1 indicates the bank 1, B2 indicates the bank 2 as shown in the figure.

- Do not operate fuel pump when there is no fuel in lines.
- Tighten fuel hose clamps to the specified torque.

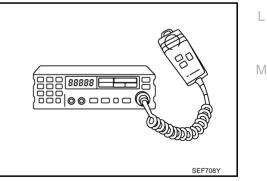

- Do not depress accelerator pedal when starting.
- Immediately after starting, do not rev up engine unnecessarily.
- Do not rev up engine just prior to shutdown.

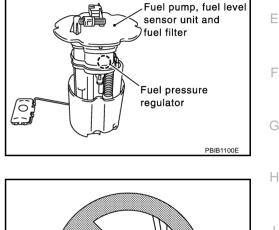

- When installing C.B. ham radio or a mobile phone, be sure to observe the following as it may adversely affect electronic control systems depending on installation location.
- Keep the antenna as far as possible from the electronic control units.
- Keep the antenna feeder line more than 20 cm (8 in) away from the harness of electronic controls.
- Do not let them run parallel for a long distance.
- Adjust the antenna and feeder line so that the standingwave radio can be kept smaller.
- Be sure to ground the radio to vehicle body.

Wiring Diagrams and Trouble Diagnosis

When you read wiring diagrams, refer to the following:

- GI-15, "How to Read Wiring Diagrams"
- PG-4. "POWER SUPPLY ROUTING CIRCUIT" for power distribution circuit
- When you perform trouble diagnosis, refer to the following:
- GI-11, "HOW TO FOLLOW TEST GROUPS IN TROUBLE DIAGNOSES"
- GI-27, "How to Perform Efficient Diagnosis for an Electrical Incident"

Air conditioner switch* ²	Air conditioner operation			
Wheel sensor*2	Vehicle speed			G

*1: This sensor is not used to control the engine system under normal conditions.

*2: This signal is sent to the ECM through CAN communication line.

*3: ECM determines the start signal status by the signals of engine speed and battery voltage.

SYSTEM DESCRIPTION

The amount of fuel injected from the fuel injector is determined by the ECM. The ECM controls the length of time the valve remains open (injection pulse duration). The amount of fuel injected is a program value in the ECM memory. The program value is preset by engine operating conditions. These conditions are determined by input signals (for engine speed and intake air) from both the crankshaft position sensor and the mass air flow sensor.

VARIOUS FUEL INJECTION INCREASE/DECREASE COMPENSATION

In addition, the amount of fuel injected is compensated to improve engine performance under various operating conditions as listed below.

<Fuel increase>

- During warm-up
- When starting the engine
- During acceleration
- Hot-engine operation
- When selector lever is changed from N to D (A/T models)
- High-load, high-speed operation
- <Fuel decrease>
- During deceleration
- During high engine speed operation

ABS000RE

Н

L

Μ

MIXTURE RATIO FEEDBACK CONTROL (CLOSED LOOP CONTROL)

The mixture ratio feedback system provides the best air-fuel mixture ratio for driveability and emission control. The three way catalyst 1 can then better reduce CO, HC and NOx emissions. This system uses heated oxygen sensor 1 in the exhaust manifold to monitor whether the engine operation is rich or lean. The ECM adjusts the injection pulse width according to the sensor voltage signal. For more information about heated oxygen sensor 1, refer to EC-198. This maintains the mixture ratio within the range of stoichiometric (ideal air-fuel mixture).

This stage is referred to as the closed loop control condition.

Heated oxygen sensor 2 is located downstream of the three way catalyst 1. Even if the switching characteristics of heated oxygen sensor 1 shift, the air-fuel ratio is controlled to stoichiometric by the signal from heated oxygen sensor 2.

Open Loop Control

The open loop system condition refers to when the ECM detects any of the following conditions. Feedback control stops in order to maintain stabilized fuel combustion.

- Deceleration and acceleration
- High-load, high-speed operation
- Malfunction of heated oxygen sensor 1 or its circuit
- Insufficient activation of heated oxygen sensor 1 at low engine coolant temperature
- High engine coolant temperature
- During warm-up
- After shifting from N to D (A/T models)
- When starting the engine

MIXTURE RATIO SELF-LEARNING CONTROL

The mixture ratio feedback control system monitors the mixture ratio signal transmitted from heated oxygen sensor 1. This feedback signal is then sent to the ECM. The ECM controls the basic mixture ratio as close to the theoretical mixture ratio as possible. However, the basic mixture ratio is not necessarily controlled as originally designed. Both manufacturing differences (i.e., mass air flow sensor hot wire) and characteristic changes during operation (i.e., injector clogging) directly affect mixture ratio.

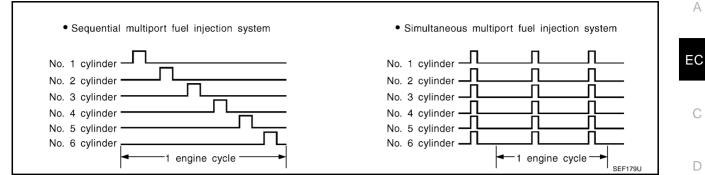

Accordingly, the difference between the basic and theoretical mixture ratios is monitored in this system. This is then computed in terms of "injection pulse duration" to automatically compensate for the difference between the two ratios.

"Fuel trim" refers to the feedback compensation value compared against the basic injection duration. Fuel trim includes short term fuel trim and long term fuel trim.

"Short term fuel trim" is the short-term fuel compensation used to maintain the mixture ratio at its theoretical value. The signal from heated oxygen sensor 1 indicates whether the mixture ratio is RICH or LEAN compared to the theoretical value. The signal then triggers a reduction in fuel volume if the mixture ratio is rich, and an increase in fuel volume if it is lean.

"Long term fuel trim" is overall fuel compensation carried out long-term to compensate for continual deviation of the short term fuel trim from the central value. Such deviation will occur due to individual engine differences, wear over time and changes in the usage environment.

FUEL INJECTION TIMING

Two types of systems are used.

Sequential Multiport Fuel Injection System

Fuel is injected into each cylinder during each engine cycle according to the firing order. This system is used when the engine is running.

Simultaneous Multiport Fuel Injection System

Fuel is injected simultaneously into all six cylinders twice each engine cycle. In other words, pulse signals of the same width are simultaneously transmitted from the ECM.

The six injectors will then receive the signals two times for each engine cycle.

This system is used when the engine is being started and/or if the fail-safe system (CPU) is operating.

FUEL SHUT-OFF

Fuel to each cylinder is cut off during deceleration or operation of the engine at excessively high speeds.

Electronic Ignition (EI) System INPUT/OUTPUT SIGNAL CHART

Sensor	Input Signal to ECM	ECM function	Actuator	
Crankshaft position sensor (POS)	Engine speed*2			
Camshaft position sensor (PHASE)	Piston position			
Mass air flow sensor	Amount of intake air			
Engine coolant temperature sensor	Engine coolant temperature			
Throttle position sensor	Throttle position	Ignition timing		
Accelerator pedal position sensor	Accelerator pedal position	control	Power transistor	
Knock sensor	Engine knocking			
Park/neutral position (PNP) switch	Gear position			
Battery	Battery voltage*2			
Wheel sensor* ¹	Vehicle speed			

*1: This signal is sent to the ECM through CAN communication line.

*2: ECM determines the start signal status by the signals of engine speed and battery voltage.

SYSTEM DESCRIPTION

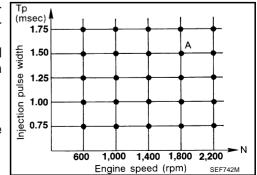

The ignition timing is controlled by the ECM to maintain the best airfuel ratio for every running condition of the engine. The ignition timing data is stored in the ECM. This data forms the map shown.

The ECM receives information such as the injection pulse width and camshaft position sensor signal. Computing this information, ignition signals are transmitted to the power transistor.

e.g., N: 1,800 rpm, Tp: 1.50 msec A °BTDC

During the following conditions, the ignition timing is revised by the ECM according to the other data stored in the ECM.

- At starting
- During warm-up

EC-27

F

F

Н

ABS000RF

- At idle
- At low battery voltage
- During acceleration

The knock sensor retard system is designed only for emergencies. The basic ignition timing is programmed within the anti-knocking zone, if recommended fuel is used under dry conditions. The retard system does not operate under normal driving conditions. If engine knocking occurs, the knock sensor monitors the condition. The signal is transmitted to the ECM. The ECM retards the ignition timing to eliminate the knocking condition.

Air Conditioning Cut Control INPUT/OUTPUT SIGNAL CHART

ABS000RG

Sensor	Input Signal to ECM	ECM function	Actuator	
Air conditioner switch* ¹	Air conditioner ON signal			
Throttle position sensor	Throttle position			
Accelerator pedal position sensor	Accelerator pedal position			
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed*2	Air conditioner		
Engine coolant temperature sensor	Engine coolant temperature	cut control	Air conditioner relay	
Battery	Battery voltage*2			
Refrigerant pressure sensor	Refrigerant pressure			
Power steering pressure sensor	Power steering operation			
Wheel sensor*1	Vehicle speed			

*1: This signal is sent to the ECM through CAN communication line.

*2: ECM determines the start signal status by the signals of engine speed and battery voltage.

SYSTEM DESCRIPTION

This system improves engine operation when the air conditioner is used. Under the following conditions, the air conditioner is turned off.

- When the accelerator pedal is fully depressed.
- When cranking the engine.
- At high engine speeds.
- When the engine coolant temperature becomes excessively high.
- When operating power steering during low engine speed or low vehicle speed.
- When engine speed is excessively low.
- When refrigerant pressure is excessively low or high.

Fuel Cut Control (at No Load and High Engine Speed) INPUT/OUTPUT SIGNAL CHART

ABS000RH

Sensor	Input Signal to ECM	ECM function	Actuator
Park/neutral position (PNP) switch	Neutral position		
Accelerator pedal position sensor	Accelerator pedal position		
Engine coolant temperature sensor	Engine coolant temperature	Fuel cut con-	Fuel injector
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed	trol	
Wheel sensor*	Vehicle speed		

*: This signal is sent to the ECM through CAN communication line.

SYSTEM DESCRIPTION

If the engine speed is above 1,800 rpm with no load (for example, the shift position is neutral and engine speed is over 1,800 rpm) fuel will be cut off after some time. The exact time when the fuel is cut off varies based on engine speed.

Fuel cut will operate until the engine speed reaches 1,500 rpm, then fuel cut is cancelled.

NOTE:

This function is different from deceleration control listed under Multiport Fuel Injection (MFI) System, EC-25.

CAN communication SYSTEM DESCRIPTION

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only. Refer to LAN-4, "CAN COMMUNICATION", about CAN communication for detail.

Idle Speed and Ignition Timing Check IDLE SPEED With CONSULT-II

Check idle speed in "DATA MONITOR" mode with CONSULT-II.

With GST

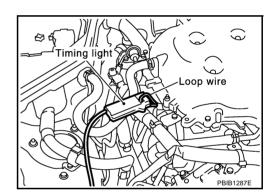

Check idle speed with GST.

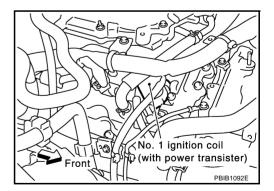

IGNITION TIMING

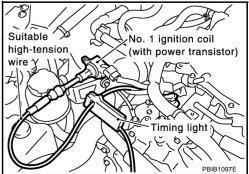

Any of following two methods may be used.

Method A

- 1. Attach timing light to loop wire as shown.
- 2. Check ignition timing.

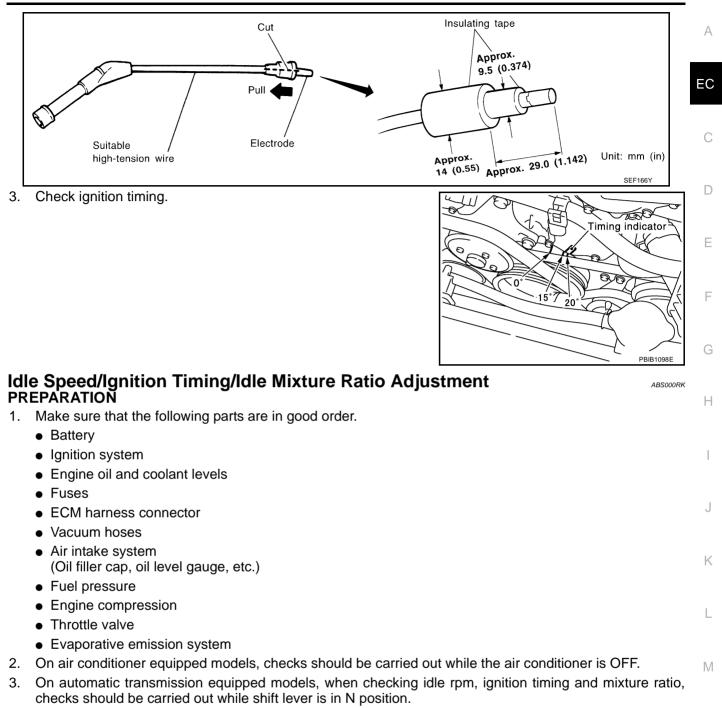

Method B

1. Remove No. 1 ignition coil.

2. Connect No. 1 ignition coil and No. 1 spark plug with suitable high-tension wire as shown, and attach timing light clamp to this wire.

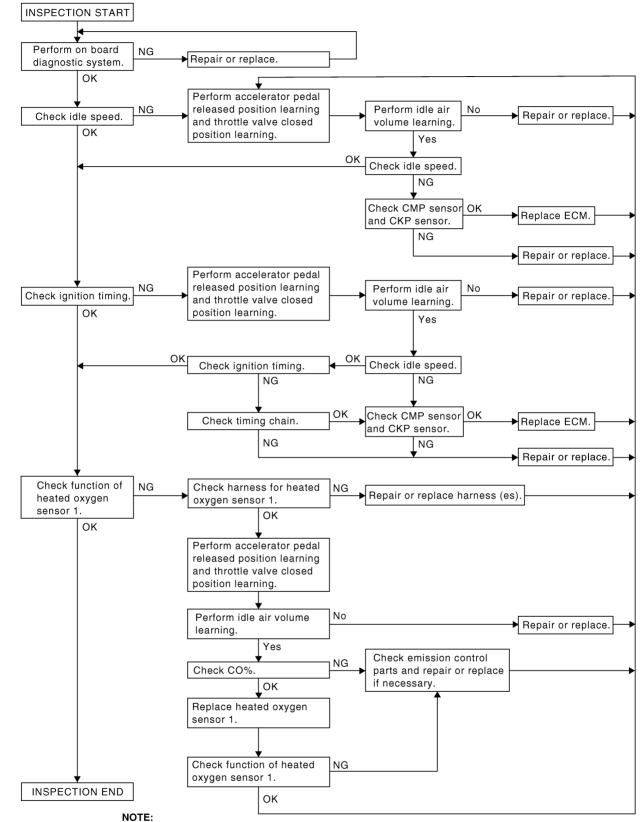

PFP:00018

ABS000RJ

- 4. When measuring CO percentage, insert probe more than 40 cm (15.7 in) into tail pipe.
- 5. Turn off headlamp, heater blower, rear window defogger.
- 6. Keep front wheels pointed straight ahead.

OVERALL INSPECTION SEQUENCE

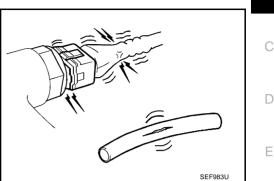

If a vehicle contains a part which is operating outside of design specifications with no MIL illumination, the part shall not be replaced prior to emission testing unless it is determined that the part has been tampered with or abused in such a way that the diagnostic system cannot reasonably be expected to detect the resulting malfunction.

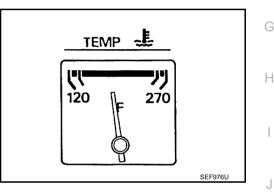

PBIB2001E

INSPECTION PROCEDURE

1. INSPECTION START

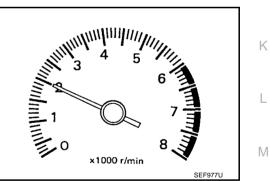

- 1. Check service records for any recent repairs that may indicate a related malfunction, or a current need for scheduled maintenance.
- 2. Open engine hood and check the following:
- Harness connectors for improper connections
- Wiring harness for improper connections, pinches and cut
- Vacuum hoses for splits, kinks and improper connections
- Hoses and ducts for leaks
- Air cleaner clogging
- Gasket
- 3. Confirm that electrical or mechanical loads are not applied.
- Head lamp switch is OFF.
- Air conditioner switch is OFF.
- Rear window defogger switch is OFF.
- Steering wheel is in the straight-ahead position, etc.
- 4. Start engine and warm it up until engine coolant temperature indicator points the middle of gauge. Ensure engine stays below 1,000 rpm.

- 5. Run engine at about 2,000 rpm for about 2 minutes under noload.
- 6. Make sure that no DTC is displayed with CONSULT-II or GST. OK or NG

OK	>> GO TO 3.
NG	>> GO TO 2.

2. REPAIR OR REPLACE

Repair or replace components as necessary according to corresponding Diagnostic Procedure.

(B) With CONSULT-II

- 1. Start engine and warm it up until engine coolant temperature indicator points the middle of gauge.
- 2. Turn ignition switch OFF, wait at least 10 seconds and then turn ON.
- 3. Select "ENG COOLANT TEMP" in "ACTIVE TEST" mode.
- Set "ENG COOLANT TEMP" to 5°C (41°F) by touching "DWN" and "Qd".
- 5. Start engine and rev it (2,000 to 3,000 rpm) two or three times under no-load, then run engine at idle speed.
- 6. Check CO%.

Idle CO: 0.7 – 9.9% and engine runs smoothly.

OK or NG

OK >> GO TO 31. NG >> GO TO 30.

29. снеск со%

Without CONSULT-II

- 1. Start engine and warm it up until engine coolant temperature indicator points to the middle of gauge.
- 2. Turn ignition switch OFF.
- 3. Disconnect engine coolant temperature sensor harness connector.
- Connect a resistor (4.4 kΩ) between terminals of engine coolant temperature sensor harness connector.
- 5. Start engine and rev it (2,000 to 3,000 rpm) two or three times under no-load, then run engine at idle speed.
- 6. Check CO%.

Idle CO: 0.7 – 9.9% and engine runs smoothly.

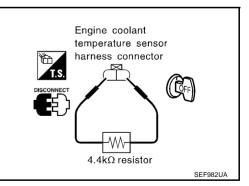

7. After checking CO%, turn ignition switch OFF, disconnect the resistor from the terminals of engine coolant temperature sensor harness connector, and then connect engine coolant temperature sensor harness connector to engine coolant temperature sensor.

OK or NG

OK	>> GO TO 31.
NG	>> GO TO 30.

30. Reconnect heated oxygen sensor 1 harness connector

- 1. Turn ignition switch OFF.
- 2. Reconnect heated oxygen sensor 1 harness connector.

33. CHECK HEATED OXYGEN SENSOR 1 (BANK 1)/(BANK 2) SIGNAL	Н
🛞 Without CONSULT-II	
1. Set ECM to Self-diagnostic mode II (Heated oxygen sensor 1 monitor). Refer to <u>EC-64, "HOW TO</u> <u>SWITCH DIAGNOSTIC TEST MODE"</u> .	I
2. Switch the monitored sensor to the malfunctioning bank. Refer to <u>EC-64</u> , "How to Switch Monitored Sensor From Bank 1 to Bank 2 or Vice Versa".	
3. Running engine at 2,000 rpm under no-load (The engine is warmed up to normal operating temperature.), check that the MIL comes on more than 5 times during 10 seconds.	J
OK or NG	IZ.
OK >> GO TO 4. NG >> GO TO 34.	Κ
34. DETECT MALFUNCTIONING PART	L
Check the following.	
• Check fuel pressure regulator and repair or replace if necessary. Refer to EC-44, "Fuel Pressure Check".	M
 Check mass air flow sensor and its circuit, and repair or replace if necessary. Refer to <u>EC-158</u> and <u>EC-166</u>. 	
Check injector and its circuit, and repair or replace if necessary. Refer to EC-584.	
 Check engine coolant temperature sensor and its circuit, and repair or replace if necessary. Refer to <u>EC-178</u> and <u>EC-190</u>. 	
OK or NG	
OK >> GO TO 36.	

- NG >> 1. Repair or replace.
 - 2. GO TO 35.

35. ERASE UNNECESSARY DTC

After this inspection, unnecessary DTC might be displayed. Erase the stored memory in ECM and TCM. Refer to <u>EC-60, "HOW TO ERASE EMISSION-RELATED DIAG-</u><u>NOSTIC INFORMATION</u>" and <u>AT-38, "HOW TO ERASE DTC</u>".

>> GO TO 4.

36. check ECM function

- 1. Substitute another known-good ECM to check ECM function. (ECM may be the cause of an incident, but this is the rarely the case.)
- 2. Perform initialization of NVIS (NATS) system and registration of NVIS (NATS) ignition key IDs. Refer to <u>BL-121, "ECM Re-communicating Function"</u>.

>> GO TO 4.

Accelerator Pedal Released Position Learning DESCRIPTION

Accelerator Pedal Released Position Learning is an operation to learn the fully released position of the accelerator pedal by monitoring the accelerator pedal position sensor output signal. It must be performed each time harness connector of accelerator pedal position sensor or ECM is disconnected.

OPERATION PROCEDURE

- 1. Make sure that accelerator pedal is fully released.
- 2. Turn ignition switch ON and wait at least 2 seconds.
- 3. Turn ignition switch OFF wait at least 10 seconds.
- 4. Turn ignition switch ON and wait at least 2 seconds.
- 5. Turn ignition switch OFF wait at least 10 seconds.

Throttle Valve Closed Position Learning DESCRIPTION

Throttle Valve Closed Position Learning is an operation to learn the fully closed position of the throttle valve by monitoring the throttle position sensor output signal. It must be performed each time harness connector of electric throttle control actuator or ECM is disconnected.

OPERATION PROCEDURE

- 1. Make sure that accelerator pedal is fully released.
- 2. Turn ignition switch ON.
- 3. Turn ignition switch OFF wait at least 10 seconds. Make sure that throttle valve moves during above 10 seconds by confirming the operating sound.

Idle Air Volume Learning DESCRIPTION

Idle Air Volume Learning is an operation to learn the idle air volume that keeps each engine within the specific range. It must be performed under any of the following conditions:

- Each time electric throttle control actuator or ECM is replaced.
- Idle speed or ignition timing is out of specification.

PREPARATION

Before performing Idle Air Volume Learning, make sure that all of the following conditions are satisfied. Learning will be cancelled if any of the following conditions are missed for even a moment.

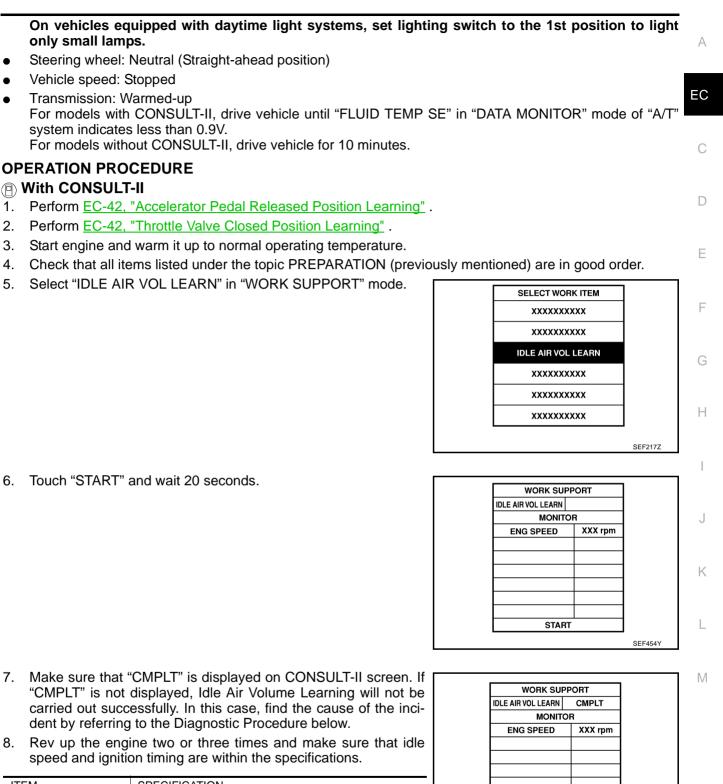

- Battery voltage: More than 12.9V (At idle)
- Engine coolant temperature: 70 100°C (158 212°F)
- PNP switch: ON
- Electric load switch: OFF (Air conditioner, headlamp, rear window defogger)

EC-42

ABS000RM

ABS000RI

ABS000RN

ITEM	SPECIFICATION
Idle speed	A/T: 650±50 rpm (in P or N position) M/T: 650±50 rpm (in N position)
Ignition timing	A/T: 15±5° BTDC (in P or N position) M/T: 15±5° BTDC (in N position)

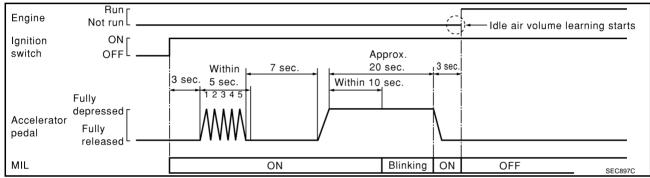

Without CONSULT-II

- It is better to count the time accurately with a clock.
- It is impossible to switch the diagnostic mode when an accelerator pedal position sensor circuit has a malfunction.

MBIB0238E

START

- 1. Perform EC-42, "Accelerator Pedal Released Position Learning" .
- 2. Perform EC-42, "Throttle Valve Closed Position Learning" .
- 3. Start engine and warm it up to normal operating temperature.
- 4. Check that all items listed under the topic PREPARATION (previously mentioned) are in good order.
- 5. Turn ignition switch OFF and wait at least 10 seconds.
- 6. Confirm that accelerator pedal is fully released, turn ignition switch ON and wait 3 seconds.
- 7. Repeat the following procedure quickly five times within 5 seconds.
- a. Fully depress the accelerator pedal.
- b. Fully release the accelerator pedal.
- 8. Wait 7 seconds, fully depress the accelerator pedal and keep it for approx. 20 seconds until the MIL stops blinking and turned ON.
- 9. Fully release the accelerator pedal within 3 seconds after the MIL turned ON.
- 10. Start engine and let it idle.
- 11. Wait 20 seconds.

12. Rev up the engine two or three times and make sure that idle speed and ignition timing are within the specifications.

ITEM	SPECIFICATION
Idle speed	A/T: 650±50 rpm (in P or N position) M/T: 650±50 rpm (in N position)
Ignition timing	A/T: 15±5° BTDC (in P or N position) M/T: 15±5° BTDC (in N position)

13. If idle speed and ignition timing are not within the specification, Idle Air Volume Learning will not be carried out successfully. In this case, find the cause of the incident by referring to the DIAGNOSTIC PROCE-DURE below.

DIAGNOSTIC PROCEDURE

If idle air volume learning cannot be performed successfully, proceed as follows:

- 1. Check that throttle valve is fully closed.
- 2. Check PCV valve operation.
- 3. Check that downstream of throttle valve is free from air leakage.
- When the above three items check out OK, engine component parts and their installation condition are questionable. Check and eliminate the cause of the incident. It is useful to perform <u>EC-124</u>, "<u>TROUBLE DIAGNOSIS - SPECIFICATION VALUE</u>".
- 5. If any of the following conditions occur after the engine has started, eliminate the cause of the incident and perform "Idle air volume learning" all over again:
 - Engine stalls.
 - Erroneous idle.

Fuel Pressure Check FUEL PRESSURE RELEASE

With CONSULT-II

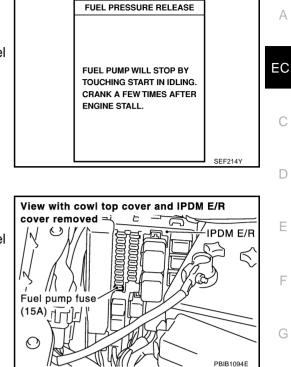

1. Turn ignition switch ON.

ABS000RO

- 2. Perform "FUEL PRESSURE RELEASE" in "WORK SUPPORT" mode with CONSULT-II.
- 3. Start engine.
- 4. After engine stalls, crank it two or three times to release all fuel pressure.
- 5. Turn ignition switch OFF.

Without CONSULT-II

- 1. Remove fuel pump fuse located in IPDM E/R.
- 2. Start engine.
- 3. After engine stalls, crank it two or three times to release all fuel pressure.
- 4. Turn ignition switch OFF.
- 5. Reinstall fuel pump fuse after servicing fuel system.

FUEL PRESSURE CHECK

Before disconnecting fuel line, release fuel pressure from fuel line to eliminate danger. NOTE:

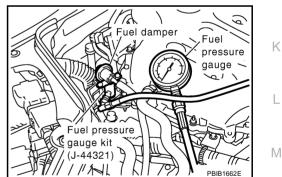

Prepare pans or saucers under the disconnected fuel line because the fuel may spill out. The fuel pressure cannot be completely released because Z33 models do not have fuel return system. Use Fuel Pressure Gauge Kit (J-44321) to check fuel pressure.

- 1. Release fuel pressure to zero. Refer to EC-44, "FUEL PRESSURE RELEASE" .
- 2. Install the inline fuel quick disconnected fitting between fuel damper and injector tube.
- 3. Connect the fuel pressure test gauge (quick connector adapter hose) to the inline fuel quick disconnected fitting.
- 4. Turn ignition switch ON and check for fuel leakage.
- 5. Start engine and check for fuel leakage.
- 6. Read the indication of fuel pressure gauge.

At idling: Approximately 350 kPa (3.57 kg/cm², 51 psi)

- 7. If result is unsatisfactory, go to next step.
- 8. Check the following.
 - Fuel hoses and fuel tubes for clogging
 - Fuel filter for clogging
 - Fuel pump
 - Fuel pressure regulator for clogging
 - If OK, replace fuel pressure regulator.

If NG, repair or replace.

Н

ON BOARD DIAGNOSTIC (OBD) SYSTEM

Introduction

PFP:00028

ABS000RP

ABS000RQ

The ECM has an on board diagnostic system, which detects malfunctions related to engine sensors or actuators. The ECM also records various emission-related diagnostic information including:

Emission-related diagnostic information	SAE Mode			
Diagnostic Trouble Code (DTC)	Mode 3 of SAE J1979			
Freeze Frame data	Mode 2 of SAE J1979			
System Readiness Test (SRT) code	Mode 1 of SAE J1979			
1st Trip Diagnostic Trouble Code (1st Trip DTC)	Mode 7 of SAE J1979			
1st Trip Freeze Frame data				
Test values and Test limits	Mode 6 of SAE J1979			
Calibration ID	Mode 9 of SAE J1979			

The above information can be checked using procedures listed in the table below.

				2	x: Applicable –	-: Not applicable
	DTC	1st trip DTC	Freeze Frame data	1st trip Freeze Frame data	SRT code	Test value
CONSULT-II	×	×	×	×	×	_
GST	×	×*1	×	_	×	×
ECM	×	×*2	—	_		—

*1: 1st trip DTCs for self-diagnoses concerning SRT items cannot be shown on the GST display.

*2: When DTC and 1st trip DTC simultaneously appear on the display, they cannot be clearly distinguished from each other.

The malfunction indicator lamp (MIL) on the instrument panel lights up when the same malfunction is detected in two consecutive trips (Two trip detection logic), or when the ECM enters fail-safe mode. (Refer to EC-76.)

Two Trip Detection Logic

When a malfunction is detected for the first time, 1st trip DTC and 1st trip Freeze Frame data are stored in the ECM memory. The MIL will not light up at this stage. <1st trip>

If the same malfunction is detected again during the next drive, the DTC and Freeze Frame data are stored in the ECM memory, and the MIL lights up. The MIL lights up at the same time when the DTC is stored. <2nd trip> The "trip" in the "Two Trip Detection Logic" means a driving mode in which self-diagnosis is performed during vehicle operation. Specific on board diagnostic items will cause the ECM to light up or blink the MIL, and store DTC and Freeze Frame data, even in the 1st trip, as shown below.

×: Applicable —: Not applicable

	MIL			DTC		1st trip DTC		
Items	1st trip		2nd trip		1st trip	On al trip	1 at trip	2nd trip
	Blinking	Lighting up	Blinking	Lighting up	displaying	2nd trip displaying	1st trip displaying	display- ing
Misfire (Possible three way cata- lyst damage) — DTC: P0300 - P0306 is being detected	×	_	_	_	_	_	×	_
Misfire (Possible three way cata- lyst damage) — DTC: P0300 - P0306 is being detected	_	_	×	_	_	×	_	_
One trip detection diagnoses (Refer to $\underline{EC-8}$.)	_	×	_	—	×	—	_	_
Except above	_	_	_	×	_	×	×	_

When there is an open circuit on MIL circuit, the ECM cannot warn the driver by lighting MIL up when there is malfunction on engine control system.

Therefore, when electrical controlled throttle and part of ECM related diagnoses are continuously detected as NG for 5 trips, ECM warns the driver that engine control system malfunctions and MIL circuit is open by means of operating fail-safe function.

The fail-safe function also operates when above diagnoses except MIL circuit are detected and demands the driver to repair the malfunction.

Engine operating condition in fail-safe mode

Engine speed will not rise more than 2,500 rpm due to the fuel cut

*1: 1st trip DTC No. is the same as DTC No.

*2: This number is prescribed by SAE J2012.

*3: In Diagnostic Test Mode II (Self-diagnostic results), this number is controlled by NISSAN.

*4: SRT code will not be set if the self-diagnostic result is NG.

*5: This is not displayed with GST.

*6: The troubleshooting for this DTC needs CONSULT-II.

*7: When the fail-safe operations for both self-diagnoses occur at the same time, the MIL illuminates.

DTC AND 1ST TRIP DTC

The 1st trip DTC (whose number is the same as the DTC number) is displayed for the latest self-diagnostic result obtained. If the ECM memory was cleared previously, and the 1st trip DTC did not reoccur, the 1st trip DTC will not be displayed.

If a malfunction is detected during the 1st trip, the 1st trip DTC is stored in the ECM memory. The MIL will not light up (two trip detection logic). If the same malfunction is not detected in the 2nd trip (meeting the required driving pattern), the 1st trip DTC is cleared from the ECM memory. If the same malfunction is detected in the 2nd trip, both the 1st trip DTC and DTC are stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up when the same malfunction occurs in two consecutive trips. If a 1st trip DTC is stored and a non-diagnostic operation is performed between the 1st and 2nd trips, only the 1st trip DTC will continue to be stored. For malfunctions that blink or light up the MIL during the 1st trip, the DTC and 1st trip DTC are stored in the ECM memory.

Procedures for clearing the DTC and the 1st trip DTC from the ECM memory are described in <u>EC-60, "HOW</u> <u>TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION"</u>

For malfunctions in which 1st trip DTCs are displayed, refer to <u>EC-47, "EMISSION-RELATED DIAGNOSTIC</u> <u>INFORMATION ITEMS"</u>. These items are required by legal regulations to continuously monitor the system/ component. In addition, the items monitored non-continuously are also displayed on CONSULT-II.

1st trip DTC is specified in Mode 7 of SAE J1979. 1st trip DTC detection occurs without lighting up the MIL and therefore does not warn the driver of a malfunction. However, 1st trip DTC detection will not prevent the vehicle from being tested, for example during Inspection/Maintenance (I/M) tests.

When a 1st trip DTC is detected, check, print out or write down and erase (1st trip) DTC and Freeze Frame data as specified in Work Flow procedure Step II, refer to <u>EC-72, "WORK FLOW"</u>. Then perform DTC Confir-

mation Procedure or Overall Function Check to try to duplicate the malfunction. If the malfunction is duplicated, the item requires repair.

How to Read DTC and 1st Trip DTC

DTC and 1st trip DTC can be read by the following methods.

With CONSULT-II

(Given With GST)

CONSULT-II or GST (Generic Scan Tool) Examples: P0340, P1148, P1706, etc.

These DTCs are prescribed by SAE J2012.

(CONSULT-II also displays the malfunctioning component or system.)

📖 No Tools

The number of blinks of the MIL in the Diagnostic Test Mode II (Self-Diagnostic Results) indicates the DTC. Example: 0340, 1148, 1706, etc.

These DTCs are controlled by NISSAN.

- 1st trip DTC No. is the same as DTC No.
- Output of a DTC indicates a malfunction. However, GST or the Diagnostic Test Mode II do not indicate whether the malfunction is still occurring or has occurred in the past and has returned to normal. CONSULT-II can identify malfunction status as shown below. Therefore, using CONSULT-II (if available) is recommended.

A sample of CONSULT-II display for DTC and 1st trip DTC is shown below. DTC or 1st trip DTC of a malfunction is displayed in SELF-DIAGNOSTIC RESULTS mode of CONSULT-II. Time data indicates how many times the vehicle was driven after the last detection of a DTC.

If the DTC is being detected currently, the time data will be [0].

If a 1st trip DTC is stored in the ECM, the time data will be [1t].

	SELF DIAG RESU	ILTS		SELF DIAG RESU	ILTS	
	DTC RESULTS	TIME		DTC RESULTS	TIME	
CKP SEN/CIRCUIT [P0335] DTC display	o	1st trip	CKP SEN/CIRCUIT [P0335]	1t		
		DTC display				
						PBIB0911E

FREEZE FRAME DATA AND 1ST TRIP FREEZE FRAME DATA

The ECM records the driving conditions such as fuel system status, calculated load value, engine coolant temperature, short term fuel trim, long term fuel trim, engine speed, vehicle speed, base fuel schedule and intake air temperature at the moment a malfunction is detected.

Data which are stored in the ECM memory, along with the 1st trip DTC, are called 1st trip freeze frame data. The data, stored together with the DTC data, are called freeze frame data and displayed on CONSULT-II or GST. The 1st trip freeze frame data can only be displayed on the CONSULT-II screen, not on the GST. For details, see EC-107, "Freeze Frame Data and 1st Trip Freeze Frame Data".

Only one set of freeze frame data (either 1st trip freeze frame data or freeze frame data) can be stored in the ECM. 1st trip freeze frame data is stored in the ECM memory along with the 1st trip DTC. There is no priority for 1st trip freeze frame data and it is updated each time a different 1st trip DTC is detected. However, once freeze frame data (2nd trip detection/MIL on) is stored in the ECM memory, 1st trip freeze frame data is no longer stored. Remember, only one set of freeze frame data can be stored in the ECM. The ECM has the following priorities to update the data.

Priority		Items
1	Freeze frame data	Misfire — DTC: P0300 - P0306 Fuel Injection System Function — DTC: P0171, P0172, P0174, P0175
2		Except the above items (Includes A/T related items)
3	1st trip freeze frame d	ata

For example, the EGR malfunction (Priority: 2) was detected and the freeze frame data was stored in the 2nd trip. After that when the misfire (Priority: 1) is detected in another trip, the freeze frame data will be updated from the EGR malfunction to the misfire. The 1st trip freeze frame data is updated each time a different mal-

EC-51

А

EC

F

function is detected. There is no priority for 1st trip freeze frame data. However, once freeze frame data is stored in the ECM memory, 1st trip freeze data is no longer stored (because only one freeze frame data or 1st trip freeze frame data can be stored in the ECM). If freeze frame data is stored in the ECM memory and freeze frame data with the same priority occurs later, the first (original) freeze frame data remains unchanged in the ECM memory.

Both 1st trip freeze frame data and freeze frame data (along with the DTCs) are cleared when the ECM memory is erased. Procedures for clearing the ECM memory are described in <u>EC-60, "HOW TO ERASE EMIS-SION-RELATED DIAGNOSTIC INFORMATION"</u>.

SYSTEM READINESS TEST (SRT) CODE

System Readiness Test (SRT) code is specified in Mode 1 of SAE J1979.

As part of an enhanced emissions test for Inspection & Maintenance (I/M), certain states require the status of SRT be used to indicate whether the ECM has completed self-diagnosis of major emission systems and components. Completion must be verified in order for the emissions inspection to proceed.

If a vehicle is rejected for a State emissions inspection due to one or more SRT items indicating "INCMP", use the information in this Service Manual to set the SRT to "CMPLT".

In most cases the ECM will automatically complete its self-diagnosis cycle during normal usage, and the SRT status will indicate "CMPLT" for each application system. Once set as "CMPLT", the SRT status remains "CMPLT" until the self-diagnosis memory is erased.

Occasionally, certain portions of the self-diagnostic test may not be completed as a result of the customer's normal driving pattern; the SRT will indicate "INCMP" for these items.

NOTE:

The SRT will also indicate "INCMP" if the self-diagnosis memory is erased for any reason or if the ECM memory power supply is interrupted for several hours.

If, during the state emissions inspection, the SRT indicates "CMPLT" for all test items, the inspector will continue with the emissions test. However, if the SRT indicates "INCMP" for one or more of the SRT items the vehicle is returned to the customer untested.

NOTE:

If MIL is ON during the state emissions inspection, the vehicle is also returned to the customer untested even though the SRT indicates "CMPLT" for all test items. Therefore, it is important to check SRT ("CMPLT") and DTC (No DTCs) before the inspection.

SRT Item

The table below shows required self-diagnostic items to set the SRT to "CMPLT".

SRT item (CONSULT-II indica- tion)	Perfor- mance Pri- ority*1	Required self-diagnostic items to set the SRT to "CMPLT"	Corresponding DTC No.
CATALYST	2	Three way catalyst function	P0420, P0430
EVAP SYSTEM	1	EVAP control system	P0442
	2	EVAP control system	P0456
	2	EVAP control system purge flow monitoring	P0441
HO2S	2	Heated oxygen sensor 1	P0133, P0153
		Heated oxygen sensor 1	P1143, P1163
		Heated oxygen sensor 1	P1144, P1164
		Heated oxygen sensor 2	P0139, P0159
		Heated oxygen sensor 2	P1146, P1166
		Heated oxygen sensor 2	P1147, P1167
HO2S HTR	2	Heated oxygen sensor 1 heater	P0031, P0032, P0051, P0052
		Heated oxygen sensor 2 heater	P0037, P0038, P0057, P0058

*1: If completion of several SRTs is required, perform driving patterns (DTC confirmation procedure), one by one based on the priority for models with CONSULT-II.

SRT Set Timing

SRT is set as "CMPLT" after self-diagnosis has been performed one or more times. Completion of SRT is done regardless of whether the result is OK or NG. The set timing is different between OK and NG results and is shown in the table below.

				Example		
Self-diagno	osis result	Diagnosis	$\leftarrow \text{ON} \rightarrow \text{O}$		$\begin{array}{ll} PR & PR \\ PR & PR & PR \end{array} \rightarrow \\ \end{array}$	$OFF \leftarrow ON \rightarrow$
All OK	Case 1	P0400	OK (1)	— (1)	OK (2)	— (2)
		P0402	OK (1)	— (1)	— (1)	OK (2)
		P1402	OK (1)	OK (2)	— (2)	— (2)
		SRT of EGR	"CMPLT"	"CMPLT"	"CMPLT"	"CMPLT"
	Case 2	P0400	OK (1)	— (1)	— (1)	— (1)
		P0402	— (0)	— (0)	OK (1)	— (1)
		P1402	OK (1)	OK (2)	— (2)	— (2)
		SRT of EGR	"INCMP"	"INCMP"	"CMPLT"	"CMPLT"
NG exists	Case 3	P0400	OK	OK	—	_
		P0402	_	_	_	_
		P1402	NG	_	NG	NG (Consecutive NG)
		(1st trip) DTC	1st trip DTC	—	1st trip DTC	DTC (= MIL "ON")
		SRT of EGR	"INCMP"	"INCMP"	"INCMP"	"CMPLT"

OK: Self-diagnosis is carried out and the result is OK.

NG: Self-diagnosis is carried out and the result is NG.

-: Self-diagnosis is not carried out.

When all SRT related self-diagnoses showed OK results in a single cycle (Ignition OFF-ON-OFF), the SRT will indicate "CMPLT". \rightarrow Case 1 above

А

Н

J

Κ

Т

Μ

When all SRT related self-diagnoses showed OK results through several different cycles, the SRT will indicate "CMPLT" at the time the respective self-diagnoses have at least one OK result. \rightarrow Case 2 above If one or more SRT related self-diagnoses showed NG results in 2 consecutive cycles, the SRT will also indi-

cate "CMPLT". \rightarrow Case 3 above The table above shows that the minimum number of cycles for setting SRT as "INCMP" is one (1) for each self-diagnosis (Case 1 & 2) or two (2) for one of self-diagnoses (Case 3). However, in preparation for the state

emissions inspection, it is unnecessary for each self-diagnosis to be executed twice (Case 3) for the following reasons:

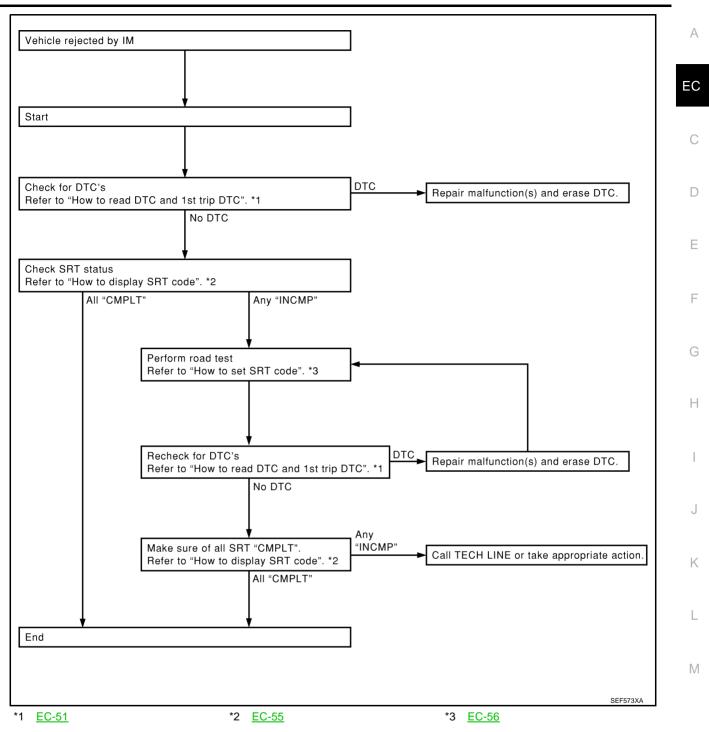

- The SRT will indicate "CMPLT" at the time the respective self-diagnoses have one (1) OK result.
- The emissions inspection requires "CMPLT" of the SRT only with OK self-diagnosis results.
- When, during SRT driving pattern, 1st trip DTC (NG) is detected prior to "CMPLT" of SRT, the self-diagnosis memory must be erased from ECM after repair.
- If the 1st trip DTC is erased, all the SRT will indicate "INCMP".

NOTE:

SRT can be set as "CMPLT" together with the DTC(s). Therefore, DTC check must always be carried out prior to the state emission inspection even though the SRT indicates "CMPLT".

SRT Service Procedure

If a vehicle has failed the state emissions inspection due to one or more SRT items indicating "INCMP", review the flowchart diagnostic sequence on the next page.

How to Display SRT Code

(I) WITH CONSULT-II

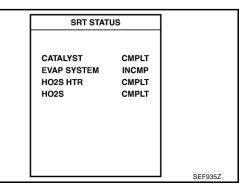

Selecting "SRT STATUS" in "DTC CONFIRMATION" mode with CONSULT-II.

For items whose SRT codes are set, a "CMPLT" is displayed on the CONSULT-II screen; for items whose SRT codes are not set, "INCMP" is displayed.

A sample of CONSULT-II display for SRT code is shown at right. "INCMP" means the self-diagnosis is incomplete and SRT is not set. "CMPLT" means the self-diagnosis is complete and SRT is set.

WITH GST

Selecting Mode 1 with GST (Generic Scan Tool)

How to Set SRT Code

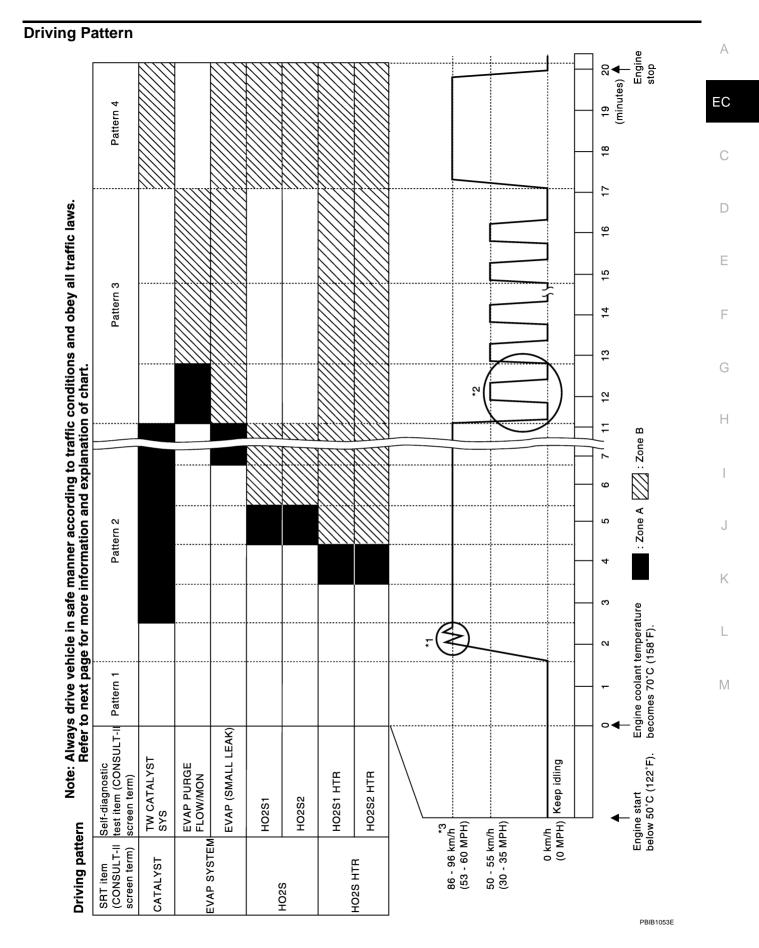

To set all SRT codes, self-diagnosis for the items indicated above must be performed one or more times. Each diagnosis may require a long period of actual driving under various conditions.

WITH CONSULT-II

Perform corresponding DTC Confirmation Procedure one by one based on Performance Priority in the table on <u>EC-53, "SRT Item"</u>.

WITHOUT CONSULT-II

The most efficient driving pattern in which SRT codes can be properly set is explained on the next page. The driving pattern should be performed one or more times to set all SRT codes.

Revision: 2004 November

2004 350Z

• The time required for each diagnosis varies with road surface conditions, weather, altitude, individual driving habits, etc.

Zone A refers to the range where the time, required for the diagnosis under normal conditions*, is the shortest.

Zone B refers to the range where the diagnosis can still be performed if the diagnosis is not completed within zone A.

*: Normal conditions refer to the following:

- Sea level
- Flat road
- Ambient air temperature: 20 30°C (68 86°F)
- Diagnosis is performed as quickly as possible under normal conditions. Under different conditions [For example: ambient air temperature other than 20 - 30°C (68 - 86°F)], diagnosis may also be performed.

Pattern 1:

- The engine is started at the engine coolant temperature of -10 to 35°C (14 to 95°F) (where the voltage between the ECM terminal 73 and ground is 3.0 4.3V).
- The engine must be operated at idle speed until the engine coolant temperature is greater than 70°C (158°F) (where the voltage between the ECM terminal 73 and ground is lower than 1.4V).
- The engine is started at the fuel tank temperature of warmer than 0°C (32°F) (where the voltage between the ECM terminal 107 and ground is less than 4.1V).

Pattern 2:

• When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Pattern 3:

• The driving pattern outlined in *2 must be repeated at least 3 times.

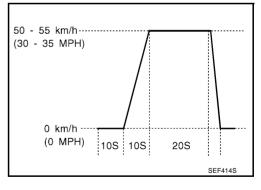

Pattern 4:

- Tests are performed after the engine has been operated for at least 17 minutes.
- The accelerator pedal must be held very steady during steady-state driving.
- If the accelerator pedal is moved, the test must be conducted all over again.

*1: Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

*2: Operate the vehicle in the following driving pattern.

- 1. Decelerate vehicle to 0 km/h (0 MPH) and let engine idle.
- 2. Repeat driving pattern shown at right at least 10 times.
- During acceleration, hold the accelerator pedal as steady as possible.
- *3: Checking the vehicle speed with GST is advised.

Suggested Transmission Gear Position

Set the selector lever in the D position.

Suggested Upshift Speeds for M/T Models

Shown below are suggested vehicle speeds for shifting into a higher gear. These suggestions relate to fuel economy and vehicle performance. Actual upshift speeds will vary according to road conditions, the weather and individual driving habits.

		on in low altitude areas I9 m (4,000 ft)]:	For quick acceleration in low altitude areas and high altitude areas [over 1,219 m (4,000 ft)]:	A
Gear change	ACCEL shift point km/h (MPH)	CRUISE shift point km/h (MPH)	km/h (MPH)	
1st to 2nd	21 (13)	13 (8)	24 (15)	EC
2nd to 3rd	37 (23)	26 (16)	40 (25)	
3rd to 4th	48 (30)	40 (25)	64 (40)	С
4th to 5th	60 (37)	45 (28)	72 (45)	
6th	68 (42)	53 (33)	80 (50)	
		l.	1	D

Suggested Maximum Speed in Each Gear

Downshift to a lower gear if the engine is not running smoothly, or if you need to accelerate.

Do not exceed the maximum suggested speed (shown below) in any gear. For level road driving, use the highest gear suggested for that speed. Always observe posted speed limits and drive according to the road conditions to ensure sage operation. Do not over-rev the engine when shifting to a lower gear as it may cause engine damage or loss of vehicle control.

Gear	km/h (MPH)	F
1st	56 (35)	
2nd	96 (60)	G
3rd	136 (85)	
4th	-	
5th	-	Н
6th	-	

TEST VALUE AND TEST LIMIT (GST ONLY — NOT APPLICABLE TO CONSULT-II)

The following is the information specified in Mode 6 of SAE J1979.

The test value is a parameter used to determine whether a system/circuit diagnostic test is OK or NG while being monitored by the ECM during self-diagnosis. The test limit is a reference value which is specified as the maximum or minimum value and is compared with the test value being monitored.

These data (test value and test limit) are specified by Test ID (TID) and Component ID (CID) and can be displayed on the GST screen.

SRT item	Self-diagnostic test itemTest valueGST display)		Test limit	Conversion

HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION How to Erase DTC

B WITH CONSULT-II

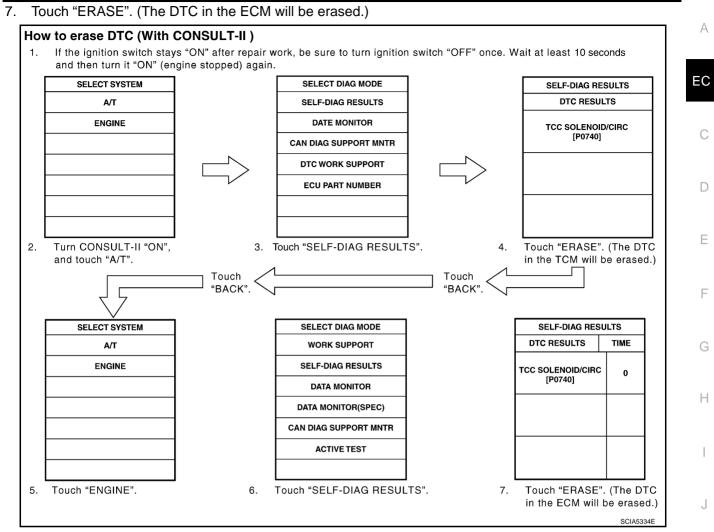

The emission related diagnostic information in the ECM can be erased by selecting "ERASE" in the "SELF-DIAG RESULTS" mode with CONSULT-II.

If DTCs are displayed for both ECM and TCM (Transmission control module), they need to be erased individually from the ECM and TCM (Transmission control module).

NOTE:

If the DTC is not for A/T related items (see $\underline{\text{EC-8}}$), skip steps 2 through 4.

- 1. If the ignition switch stays ON after repair work, be sure to turn ignition switch OFF once. Wait at least 10 seconds and then turn it ON (engine stopped) again.
- 2. Turn CONSULT-II ON and touch "A/T".
- 3. Touch "SELF-DIAG RESULTS".
- 4. Touch "ERASE". [The DTC in the TCM (Transmission control module) will be erased.] Then touch "BACK" twice.
- 5. Touch "ENGINE".
- 6. Touch "SELF-DIAG RESULTS".

WITH GST

The emission related diagnostic information in the ECM can be erased by selecting Mode 4 with GST. **NOTE:**

If the DTC is not for A/T related items (see EC-8), skip step 2.

- 1. If the ignition switch stays ON after repair work, be sure to turn ignition switch OFF once. Wait at least 10 seconds and then turn it ON (engine stopped) again.
- 2. Perform AT-39, "HOW TO ERASE DTC (WITH GST)" . (The DTC in TCM will be erased.)
- 3. Select Mode 4 with GST (Generic Scan Tool).

NO TOOLS

NOTE:

If the DTC is not for A/T related items (see EC-8), skip step 2.

- 1. If the ignition switch stays ON after repair work, be sure to turn ignition switch OFF once. Wait at least 10 seconds and then turn it ON (engine stopped) again.
- 2. Perform AT-40, "HOW TO ERASE DTC (NO TOOLS)" . (The DTC in TCM will be erased.)
- 3. Change the diagnostic test mode from Mode II to Mode I by depressing the accelerator pedal. Refer to <u>EC-64, "HOW TO SWITCH DIAGNOSTIC TEST MODE"</u>.
- If the battery is disconnected, the emission-related diagnostic information will be lost within 24 hours.
- The following data are cleared when the ECM memory is erased.
- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data

K

М

- System readiness test (SRT) codes
- Test values
- Others

Actual work procedures are explained using a DTC as an example. Be careful so that not only the DTC, but all of the data listed above, are cleared from the ECM memory during work procedures.

NVIS (Nissan Vehicle Immobilizer System — NATS)

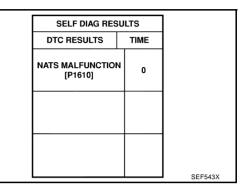

- If the security indicator lights up with the ignition switch in the ON position or "NATS MALFUNCTION" is displayed on "SELF-DIAG RESULTS" screen, perform self-diagnostic results mode with CONSULT-II using NATS program card. Refer to <u>BL-119, "NVIS (NISSAN VEHICLE IMMOBILIZER</u> SYSTEM-NATS)".
- Confirm no self-diagnostic results of NVIS (NATS) is displayed before touching "ERASE" in "SELF-DIAG RESULTS" mode with CONSULT-II.
- When replacing ECM, initialization of NVIS (NATS) system and registration of all NVIS (NATS) ignition key IDs must be carried out with CONSULT-II using NATS program card.

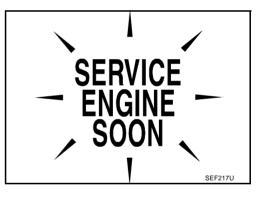

Therefore, be sure to receive all keys from vehicle owner. Regarding the procedures of NVIS (NATS) initialization and NVIS (NATS) ignition key ID registration, refer to CONSULT-II operation manual, IVIS/NVIS.

Malfunction Indicator Lamp (MIL) DESCRIPTION

The MIL is located on the instrument panel.

- 1. The MIL will light up when the ignition switch is turned ON without the engine running. This is a bulb check. If the MIL does not light up, refer to $\underline{DI-66}$, "WARNING LAMPS", or see $\underline{EC-622}$.
- When the engine is started, the MIL should go off. If the MIL remains on, the on board diagnostic system has detected an engine system malfunction.

ABS000RS

ABS000RT

ON BOARD DIAGNOSTIC SYSTEM FUNCTION

The on board diagnostic system has the following four functions.

Diagnostic Test Mode	KEY and ENG. Status	Function	Explanation of Function	
Mode I	Ignition switch in ON position	BULB CHECK	This function checks the MIL bulb for damage (blown, open circuit, etc.). If the MIL does not come on, check MIL circuit.	
	Engine running	MALFUNCTION WARNING	This is a usual driving condition. When a malfunction is detected twice in two consecutive driving cycles (two trip	-
			detection logic), the MIL will light up to inform the driver that a malfunction has been detected. The following malfunctions will light up or blink the MIL in the 1st trip.	
			Misfire (Possible three way catalyst damage)One trip detection diagnoses	
Mode II	Ignition switch in ON position	SELF-DIAGNOSTIC RESULTS	This function allows DTCs and 1st trip DTCs to be read.	
	Engine stopped			
	Engine running	HEATED OXYGEN SENSOR 1 MONITOR	This function allows the fuel mixture condition (lean or rich), monitored by heated oxygen sensor 1, to be read.	-

When there is an open circuit on MIL circuit, the ECM cannot warn the driver by lighting MIL up when there is malfunction on engine control system.

Therefore, when electrical controlled throttle and part of ECM related diagnoses are continuously detected as NG for 5 trips, ECM warns the driver that engine control system malfunctions and MIL circuit is open by means of operating fail-safe function.

The fail-safe function also operates when above diagnoses except MIL circuit are detected and demands the driver to repair the malfunction.

MIL Flashing Without DTC

If the ECM is in Diagnostic Test Mode II, MIL may flash when engine is running. In this case, check ECM diagnostic test mode. <u>EC-64, "HOW TO SWITCH DIAGNOSTIC TEST MODE"</u>.

How to switch the diagnostic test (function) modes, and details of the above functions are described later. <u>EC-64, "HOW TO SWITCH DIAGNOSTIC TEST MODE"</u>.

The following emission-related diagnostic information is cleared when the ECM memory is erased.

- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values
- Others

Μ

А

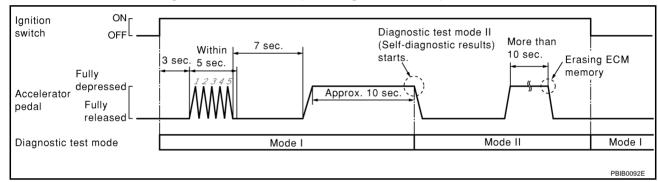

HOW TO SWITCH DIAGNOSTIC TEST MODE

NOTE:

- It is better to count the time accurately with a clock.
- It is impossible to switch the diagnostic mode when an accelerator pedal position sensor circuit has a malfunction.
- Always ECM returns to Diagnostic Test Mode I after ignition switch is turned OFF.

How to Set Diagnostic Test Mode II (Self-Diagnostic Results)

- 1. Confirm that accelerator pedal is fully released, turn ignition switch ON and wait 3 seconds.
- 2. Repeat the following procedure quickly five times within 5 seconds.
- a. Fully depress the accelerator pedal.
- b. Fully release the accelerator pedal.
- 3. Wait 7 seconds, fully depress the accelerator pedal and keep it for approx. 10 seconds until the MIL starts blinking.
- 4. Fully release the accelerator pedal. ECM has entered to Diagnostic Test Mode II (Self-diagnostic results).

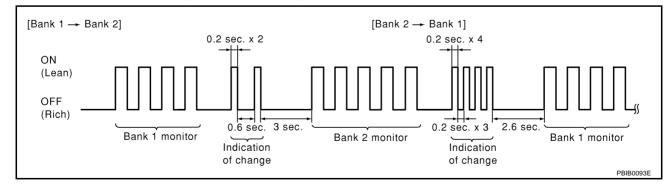

How to Set Diagnostic Test Mode II (Heated Oxygen Sensor 1 Monitor)

- 1. Set the ECM in Diagnostic Test Mode II (Self-diagnostic results). Refer to EC-64, "How to Set Diagnostic Test Mode II (Self-Diagnostic Results)".
- 2. Start Engine.

ECM has entered to Diagnostic Test Mode II (Heated oxygen sensor 1 monitor). ECM will start heated oxygen sensor 1 monitoring from the bank 1 sensor.

How to Switch Monitored Sensor From Bank 1 to Bank 2 or Vice Versa

- 1. Fully depress the accelerator pedal quickly and then release it immediately.
- 2. Make sure that monitoring sensor has changed by MIL blinking as follows.

How to Erase Diagnostic Test Mode II (Self-Diagnostic Results)

- 1. Set ECM in Diagnostic Test Mode II (Self-diagnostic results). Refer to EC-64, "How to Set Diagnostic Test Mode II (Self-Diagnostic Results)".
- 2. Fully depress the accelerator pedal and keep it for more than 10 seconds. The emission-related diagnostic information has been erased from the backup memory in the ECM.
- 3. Fully release the accelerator pedal, and confirm the DTC 0000 is displayed.

DIAGNOSTIC TEST MODE I — BULB CHECK

In this mode, the MIL on the instrument panel should stay ON. If it remains OFF, check the bulb. Refer to <u>DI-</u><u>A</u><u>66, "WARNING LAMPS"</u> or see <u>EC-622</u>.

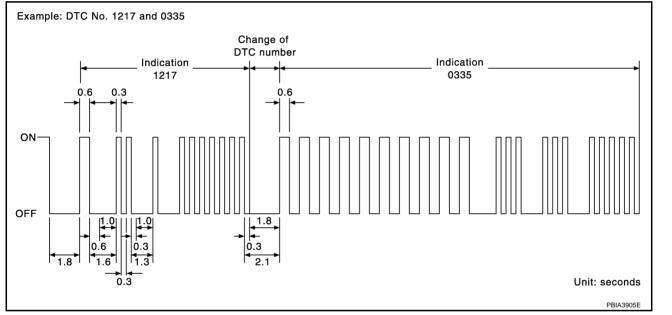

DIAGNOSTIC TEST MODE I — MALFUNCTION WARNING

MIL	Condition	
ON	When the malfunction is detected.	
OFF	No malfunction.	С

These DTC numbers are clarified in Diagnostic Test Mode II (SELF-DIAGNOSTIC RESULTS)

DIAGNOSTIC TEST MODE II — SELF-DIAGNOSTIC RESULTS

In this mode, the DTC and 1st trip DTC are indicated by the number of blinks of the MIL as shown below. The DTC and 1st trip DTC are displayed at the same time. If the MIL does not illuminate in diagnostic test mode I (Malfunction warning), all displayed items are 1st trip DTCs. If only one code is displayed when the MIL illuminates in diagnostic test mode II (SELF-DIAGNOSTIC RESULTS), it is a DTC; if two or more codes are displayed, they may be either DTCs or 1st trip DTCs. DTC No. is same as that of 1st trip DTC. These unidentified codes can be identified by using the CONSULT-II or GST. A DTC will be used as an example for how to read a code.

A particular trouble code can be identified by the number of four-digit numeral flashes. The "zero" is indicated by the number of ten flashes. The length of time the 1,000th-digit numeral flashes on and off is 1.2 seconds consisting of an ON (0.6-second) - OFF (0.6-second) cycle.

The 100th-digit numeral and lower digit numerals consist of a 0.3-second ON and 0.3-second OFF cycle. A change from one digit numeral to another occurs at an interval of 1.0-second OFF. In other words, the later numeral appears on the display 1.3 seconds after the former numeral has disappeared.

A change from one trouble code to another occurs at an interval of 1.8-second OFF.

In this way, all the detected malfunctions are classified by their DTC numbers. The DTC 0000 refers to no malfunction. (See <u>EC-8</u>, "INDEX FOR DTC")

How to Erase Diagnostic Test Mode II (Self-Diagnostic Results)

The DTC can be erased from the back up memory in the ECM by depressing accelerator pedal. Refer to <u>EC-64, "How to Erase Diagnostic Test Mode II (Self-Diagnostic Results)"</u>.

- If the battery is disconnected, the DTC will be lost from the backup memory within 24 hours.
- Be careful not to erase the stored memory before starting trouble diagnoses.

DIAGNOSTIC TEST MODE II - HEATED OXYGEN SENSOR 1 MONITOR

In this mode, the MIL displays the condition of the fuel mixture (lean or rich) which is monitored by the heated oxygen sensor 1.

Μ

K

L

F

F

Н

MIL	Fuel mixture condition in the exhaust gas	Air fuel ratio feedback control condition		
ON	Lean	Closed loop system		
OFF	Rich	Closed loop system		
*Remains ON or OFF	Any condition	Open loop system		

*: Maintains conditions just before switching to open loop.

To check the heated oxygen sensor 1 function, start engine in the Diagnostic Test Mode II and warm it up until engine coolant temperature indicator points to the middle of the gauge.

Next run engine at about 2,000 rpm for about 2 minutes under no-load conditions. Then make sure that the MIL comes ON more than 5 times within 10 seconds with engine running at 2,000 rpm under no-load.

OBD System Operation Chart RELATIONSHIP BETWEEN MIL, 1ST TRIP DTC, DTC, AND DETECTABLE ITEMS

- When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data are stored in the ECM memory.
- When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data are stored in the ECM memory, and the MIL will come on. For details, refer to <u>EC-46</u>, "Two Trip Detection <u>Logic</u>".
- The MIL will go off after the vehicle is driven 3 times with no malfunction. The drive is counted only when the recorded driving pattern is met (as stored in the ECM). If another malfunction occurs while counting, the counter will reset.
- The DTC and the freeze frame data will be stored until the vehicle is driven 40 times (driving pattern A) without the same malfunction recurring (except for Misfire and Fuel Injection System). For Misfire and Fuel Injection System, the DTC and freeze frame data will be stored until the vehicle is driven 80 times (driving pattern C) without the same malfunction recurring. The "TIME" in "SELF-DIAGNOSTIC RESULTS" mode of CONSULT-II will count the number of times the vehicle is driven.
- The 1st trip DTC is not displayed when the self-diagnosis results in OK for the 2nd trip.

Items	Fuel Injection System	Misfire	Other 3 (pattern B)	
MIL (goes off)	3 (pattern B)	3 (pattern B)		
DTC, Freeze Frame Data (no display)	80 (pattern C) 80 (pattern C)		40 (pattern A)	
1st Trip DTC (clear)	1 (pattern C), *1	1 (pattern C), *1	1 (pattern B)	
1st Trip Freeze Frame Data (clear)	*1, *2	*1, *2	1 (pattern B)	

SUMMARY CHART

For details about patterns B and C under "Fuel Injection System" and "Misfire", see EC-68.

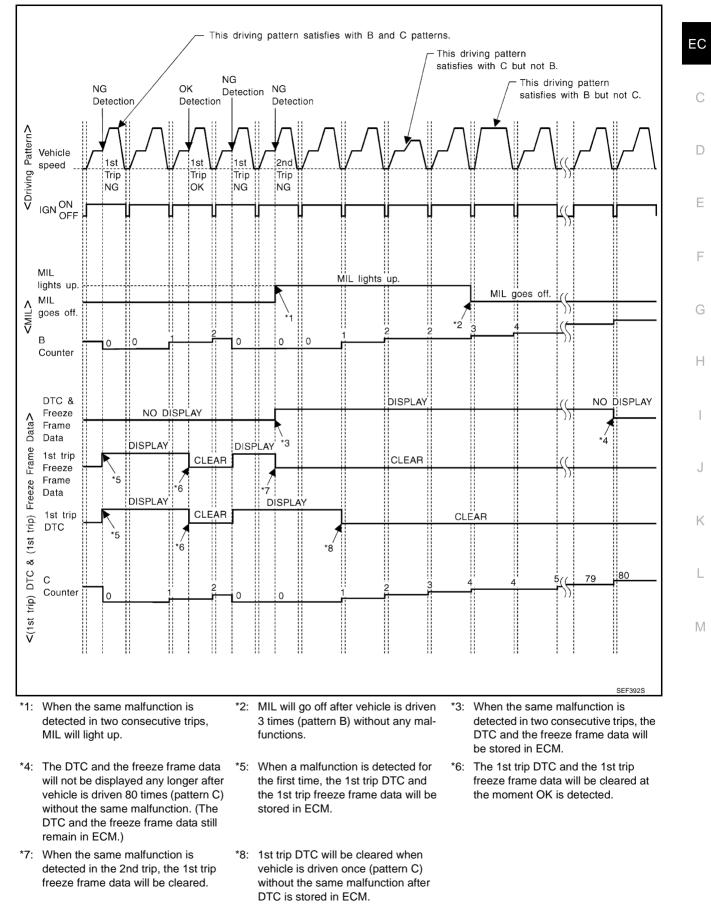

For details about patterns A and B under "Other", see EC-70.

*1: Clear timing is at the moment OK is detected.

*2: Clear timing is when the same malfunction is detected in the 2nd trip.

ABSOOORIJ

RELATIONSHIP BETWEEN MIL, DTC, 1ST TRIP DTC AND DRIVING PATTERNS FOR "MISFIRE "<EXHAUST QUALITY DETERIORATION>, "FUEL INJECTION SYSTEM"

А

EXPLANATION FOR DRIVING PATTERNS FOR "MISFIRE <EXHAUST QUALITY DETERIORA-TION>", "FUEL INJECTION SYSTEM"

<Driving Pattern B>

Driving pattern B means the vehicle operation as follows:

- All components and systems should be monitored at least once by the OBD system.
- The B counter will be cleared when the malfunction is detected once regardless of the driving pattern.
- The B counter will be counted up when driving pattern B is satisfied without any malfunction.
- The MIL will go off when the B counter reaches 3. (*2 in OBD SYSTEM OPERATION CHART)

<Driving Pattern C>

Driving pattern C means the vehicle operation as follows:

The following conditions should be satisfied at the same time:

Engine speed: (Engine speed in the freeze frame data) ±375 rpm

Calculated load value: (Calculated load value in the freeze frame data) x (1 ± 0.1) [%] Engine coolant temperature (T) condition:

- When the freeze frame data shows lower than 70°C (158°F), T should be lower than 70°C (158°F).
- When the freeze frame data shows higher than or equal to 70°C (158°F), T should be higher than or equal to 70°C (158°F).

Example:

If the stored freeze frame data is as follows:

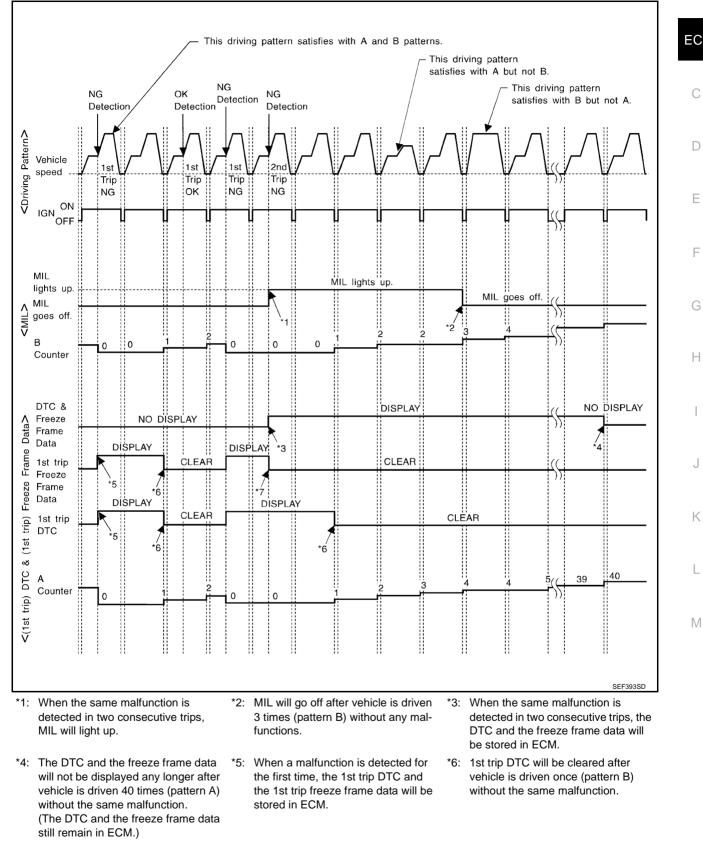

Engine speed: 850 rpm, Calculated load value: 30%, Engine coolant temperature: 80°C (176°F)

To be satisfied with driving pattern C, the vehicle should run under the following conditions:

Engine speed: 475 - 1,225 rpm, Calculated load value: 27 - 33%, Engine coolant temperature: more than 70°C (158°F)

- The C counter will be cleared when the malfunction is detected regardless of vehicle conditions above.
- The C counter will be counted up when vehicle conditions above is satisfied without the same malfunction.
- The DTC will not be displayed after C counter reaches 80.
- The 1st trip DTC will be cleared when C counter is counted once without the same malfunction after DTC is stored in ECM.

RELATIONSHIP BETWEEN MIL, DTC, 1ST TRIP DTC AND DRIVING PATTERNS <u>EXCEPT</u> FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

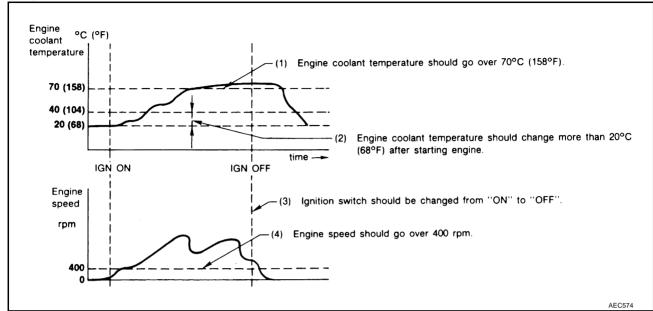

*7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.

А

EXPLANATION FOR DRIVING PATTERNS <u>EXCEPT</u> FOR "MISFIRE < EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

<Driving Pattern A>

- The A counter will be cleared when the malfunction is detected regardless of (1) (4).
- The A counter will be counted up when (1) (4) are satisfied without the same malfunction.
- The DTC will not be displayed after the A counter reaches 40.

<Driving Pattern B>

Driving pattern B means the vehicle operation as follows:

- All components and systems should be monitored at least once by the OBD system.
- The B counter will be cleared when the malfunction is detected once regardless of the driving pattern.
- The B counter will be counted up when driving pattern B is satisfied without any malfunctions.
- The MIL will go off when the B counter reaches 3 (*2 in OBD SYSTEM OPERATION CHART).

TROUBLE DIAGNOSIS

Trouble Diagnosis Introduction INTRODUCTION

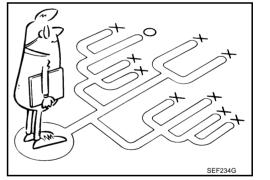

The engine has an ECM to control major systems such as fuel control, ignition control, idle air control system, etc. The ECM accepts input signals from sensors and instantly drives actuators. It is essential that both input and output signals are proper and stable. At the same time, it is important that there are no malfunctions such as vacuum leaks, fouled spark plugs, or other malfunctions with the engine.

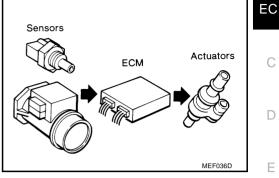

It is much more difficult to diagnose an incident that occurs intermittently rather than continuously. Most intermittent incidents are caused by poor electric connections or improper wiring. In this case, careful checking of suspected circuits may help prevent the replacement of good parts.

A visual check only may not find the cause of the incidents. A road test with CONSULT-II (or GST) or a circuit tester connected should be performed. Follow the Work Flow on <u>EC-72</u>.

Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a driveability complaint. The customer can supply good information about such incidents, especially intermittent ones. Find out what symptoms are present and under what conditions they occur. A "Diagnostic Worksheet" like the example on <u>EC-74</u> should be used.

Start your diagnosis by looking for conventional malfunctions first. This will help troubleshoot driveability malfunctions on an electronically controlled engine vehicle.

Description for Work Flow

STEP	DESCRIPTION
STEP I	Get detailed information about the conditions and the environment when the incident/symptom occurred using the DIAGNOSTIC WORK SHEET, EC-73.
STEP II	Before confirming the concern, check and write down (print out using CONSULT-II or GST) the (1st trip) DTC and the (1st trip) freeze frame data, then erase the DTC and the data. (Refer to $\underline{\text{EC-60}}$.) The (1st trip) DTC and the (1st trip) freeze frame data can be used when duplicating the incident at STEP III & IV.If the incident cannot be verified, perform $\underline{\text{EC-128}}$. "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT"Study the relationship between the cause, specified by (1st trip) DTC, and the symptom described by the customer. (The Symptom Matrix Chart will be useful. See $\underline{\text{EC-82}}$.)Also check related service bulletins for information.
STEP III	Try to confirm the symptom and under what conditions the incident occurs. The DIAGNOSTIC WORK SHEET and the freeze frame data are useful to verify the incident. Connect CONSULT-II to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform <u>EC-128</u> , <u>"TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT"</u> . If the malfunction code is detected, skip STEP IV and perform STEP V.
STEP IV	Try to detect the (1st trip) DTC by driving in (or performing) the DTC Confirmation Procedure. Check and read the (1sttrip) DTC and (1st trip) freeze frame data by using CONSULT-II or GST.During the (1st trip) DTC verification, be sure to connect CONSULT-II to the vehicle in DATA MONITOR (AUTO TRIG)mode and check real time diagnosis results.If the incident cannot be verified, perform EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT".In case the DTC Confirmation Procedure is not available, perform the Overall Function Check instead. The (1st trip)DTC cannot be displayed by this check, however, this simplified check is an effective alternative.The NG result of the Overall Function Check is the same as the (1st trip) DTC detection.
STEP V	Take the appropriate action based on the results of STEP I through IV. If the malfunction code is indicated, proceed to TROUBLE DIAGNOSIS FOR DTC PXXXX. If the normal code is indicated, proceed to the BASIC INSPECTION. (Refer to EC-77.) Then perform inspections according to the Symptom Matrix Chart. (Refer to EC-82.)
STEP VI	Identify where to begin diagnosis based on the relationship study between symptom and possible causes. Inspect the system for mechanical binding, loose connectors or wiring damage using (tracing) Harness Layouts. Gently shake the related connectors, components or wiring harness with CONSULT-II set in "DATA MONITOR (AUTO TRIG)" mode. Check the voltage of the related ECM terminals or monitor the output data from the related sensors with CONSULT-II. Refer to EC-94, EC-118. The Diagnostic Procedure in EC section contains a description based on open circuit inspection. A short circuit inspection is also required for the circuit check in the Diagnostic Procedure. For details, refer to Circuit Inspection in GI-27, "How to Perform Efficient Diagnosis for an Electrical Incident". Repair or replace the malfunction parts. If malfunctioning part cannot be detected, perform EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT".
STEP VII	Once you have repaired the circuit or replaced a component, you need to run the engine in the same conditions and circumstances which resulted in the customer's initial complaint. Perform the DTC Confirmation Procedure and confirm the normal code [DTC No. P0000] is detected. If the incident is still detected in the final check, perform STEP VI by using a method different from the previous one. Before returning the vehicle to the customer, be sure to erase the unnecessary (already fixed) (1st trip) DTC in ECM and TCM (Transmission control module). (Refer to <u>EC-60. "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION"</u> and <u>AT-38. "HOW TO ERASE DTC"</u> .)

DIAGNOSTIC WORKSHEET

Description

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make troubleshooting faster and more accurate.

In general, each customer feels differently about a incident. It is important to fully understand the symptoms or conditions for a customer complaint.

Utilize a diagnostic worksheet like the one on the next page in order to organize all the information for troubleshooting.

Some conditions may cause the MIL to come on steady or blink and DTC to be detected. Examples:

• Vehicle ran out of fuel, which caused the engine to misfire.

KEY POINTS

WHAT.....Vehicle & engine modelWHEN.....Date, FrequenciesWHERERoad conditionsHOW.....Operating conditions,

 When there is an open circuit on MIL circuit, the ECM cannot warn the driver by lighting MIL up when there is malfunction on engine control system.

Therefore, when electrical controlled throttle and part of ECM related diagnoses are continuously detected as NG for 5 trips, ECM warns the driver that engine control system malfunctions and MIL circuit is open by means of operating fail-safe function.

The fail-safe function also operates when above diagnoses except MIL circuit are detected and demands the driver to repair the malfunction.

Engine speed will not rise more than 2,500 rpm due to the fuel cut

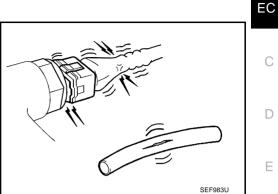

Engine operating condition in fail-safe mode

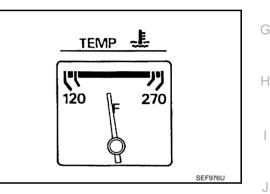

ABS000RX

Basic Inspection

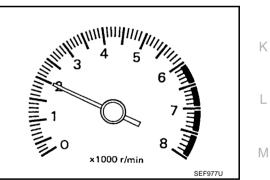

1. INSPECTION START

- 1. Check service records for any recent repairs that may indicate a related malfunction, or a current need for scheduled maintenance.
- 2. Open engine hood and check the following:
- Harness connectors for improper connections
- Wiring harness for improper connections, pinches and cut
- Vacuum hoses for splits, kinks and improper connections _
- Hoses and ducts for leaks
- Air cleaner clogging
- Gasket
- 3. Confirm that electrical or mechanical loads are not applied.
- Headlamp switch is OFF.
- Air conditioner switch is OFF.
- Rear window defogger switch is OFF.
- Steering wheel is in the straight-ahead position, etc.
- 4. Start engine and warm it up until engine coolant temperature indicator points the middle of gauge. Ensure engine stays below 1,000 rpm.

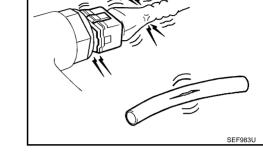

- Run engine at about 2,000 rpm for about 2 minutes under no-5. load.
- 6. Make sure that no DTC is displayed with CONSULT-II or GST. OK or NG
- OK >> GO TO 3. NG >> GO TO 2.

2. REPAIR OR REPLACE

Repair or replace components as necessary according to corresponding Diagnostic Procedure.

>> GO TO 3.

ABS000RY

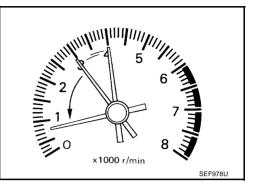

А

F

3. CHECK TARGET IDLE SPEED

(P) With CONSULT-II

- 1. Run engine at about 2,000 rpm for about 2 minutes under no-load.
- 2. Rev engine (2,000 to 3,000 rpm) two or three times under noload, then run engine at idle speed for about 1 minute.

3. Read idle speed in "DATA MONITOR" mode with CONSULT-II.

- A/T: 650 \pm 50 rpm (in P or N position)
- M/T: 650 ± 50 rpm (in N position)

DATA M	ONITOR	
MONITOR	NO DTC	
ENG SPEED	XXX rpm	
		SEF058

Without CONSULT-II

- 1. Run engine at about 2,000 rpm for about 2 minutes under no-load.
- Rev engine (2,000 to 3,000 rpm) two or three times under no-load, then run engine at idle speed for about 1 minute.
- 3. Check idle speed.
 - A/T: 650 \pm 50 rpm (in P or N position)

M/T: 650 ± 50 rpm (in N position)

OK or NG

```
OK >> GO TO 10.
NG >> GO TO 4.
```

4. PERFORM ACCELERATOR PEDAL RELEASED POSITION LEARNING

- 1. Stop engine.
- 2. Perform EC-42, "Accelerator Pedal Released Position Learning" .

```
>> GO TO 5.
```

5. PERFORM THROTTLE VALVE CLOSED POSITION LEARNING

Perform EC-42, "Throttle Valve Closed Position Learning" .

>> GO TO 6.

6. PERFORM IDLE AIR VOLUME LEARNING	Δ
Refer to <u>EC-42, "Idle Air Volume Learning"</u> . Is Idle Air Volume Learning carried out successfully?	A
Yes or No	EC
Yes >> GO TO 7. No >> 1. Follow the instruction of Idle Air Volume Learning. 2. GO TO 4.	С
7. CHECK TARGET IDLE SPEED AGAIN	
With CONSULT-II	D
 Start engine and warm it up to normal operating temperature. Read idle speed in "DATA MONITOR" mode with CONSULT-II. 	E
A/T: 650 \pm 50 rpm (in P or N position) M/T: 650 \pm 50 rpm (in N position)	F
Without CONSULT-II	I
 Start engine and warm it up to normal operating temperature. Check idle speed. 	G
A/T: 650 \pm 50 rpm (in P or N position) M/T: 650 \pm 50 rpm (in N position)	Н
OK or NG	
OK >> GO TO 10. NG >> GO TO 8.	I
8. DETECT MALFUNCTIONING PART	
Check the following.	J
 Check camshaft position sensor (PHASE) and circuit. Refer to EC-300. Check crankabett position sensor (POS) and circuit. Refer to EC-304. 	
 Check crankshaft position sensor (POS) and circuit. Refer to <u>EC-294</u>. OK or NG 	K
OK >> GO TO 9. NG >> 1. Repair or replace. 2. GO TO 4.	L
9. CHECK ECM FUNCTION	
1. Substitute another known-good ECM to check ECM function. (ECM may be the cause of an inc	M cident, but

this is the rarely the case.)

 Perform initialization of NVIS (NATS) system and registration of NVIS (NATS) ignition key IDs. Refer to EC-62, "NVIS (Nissan Vehicle Immobilizer System — NATS)".

>> GO TO 4.

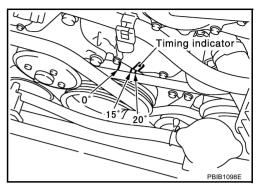

10. CHECK IGNITION TIMING

- 1. Run engine at idle.
- 2. Check ignition timing with a timing light.
 - A/T: $15 \pm 5^{\circ}$ BTDC (in P or N position)

M/T: $15 \pm 5^{\circ}$ BTDC (in N position)

OK or NG

- OK >> INSPECTION END
- NG >> GO TO 11.

11. PERFORM ACCELERATOR PEDAL RELEASED POSITION LEARNING

- 1. Stop engine.
- 2. Perform EC-42, "Accelerator Pedal Released Position Learning" .

>> GO TO 12.

12. PERFORM THROTTLE VALVE CLOSED POSITION LEARNING

Perform EC-42, "Throttle Valve Closed Position Learning" .

>> GO TO 13.

13. PERFORM IDLE AIR VOLUME LEARNING

Refer to EC-42, "Idle Air Volume Learning" .

Is Idle Air Volume Learning carried out successfully?

Yes or No

Yes >> GO TO 14.

No >> 1. Follow the instruction of Idle Air Volume Learning. 2. GO TO 4.

14. CHECK TARGET IDLE SPEED AGAIN

With CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Read idle speed in "DATA MONITOR" mode with CONSULT-II.

A/T: 650 \pm 50 rpm (in P or N position)

M/T: 650 ± 50 rpm (in N position)

Without CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Check idle speed.
 - A/T: 650 ± 50 rpm (in P or N position)

M/T: 650 ± 50 rpm (in N position)

OK or NG

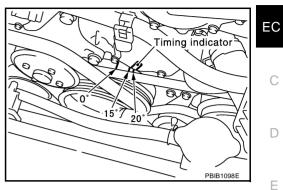

OK >> GO TO 15. NG >> GO TO 17.

15. CHECK IGNITION TIMING AGAIN

- 1. Run engine at idle.
- 2. Check ignition timing with a timing light.
 - A/T: $15 \pm 5^{\circ}$ BTDC (in P or N position)
 - M/T: $15 \pm 5^{\circ}$ BTDC (in N position)

OK or NG

- OK >> INSPECTION END
- NG >> GO TO 16.

А

16. CHECK TIMING CHAIN INSTALLATION	
Check timing chain installation. Refer to <u>EM-49, "TIMING CHAIN"</u> . <u>OK or NG</u> OK >> GO TO 17.	F
NG >> 1. Repair the timing chain installation.2. GO TO 4.	G
17. DETECT MALFUNCTIONING PART	Н
Check the following.	
 Check camshaft position sensor (PHASE) and circuit. Refer to <u>EC-300</u>. Check crankshaft position sensor (POS) and circuit. Refer to <u>EC-294</u>. 	I
OK or NG OK >> GO TO 18. NG >> 1. Repair or replace. 2. GO TO 4.	J
18. CHECK ECM FUNCTION	Κ
 Substitute another known-good ECM to check ECM function. (ECM may be the cause of an incident, but this is the rarely the case.) 	I
 Perform initialization of NVIS (NATS) system and registration of NVIS (NATS) ignition key IDs. Refer to EC-62, "NVIS (Nissan Vehicle Immobilizer System — NATS)". 	

>> GO TO 4.

Circuit Diagram

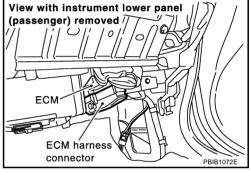

ECM Harness Connector Terminal Layout

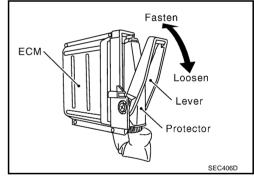

ECM Terminals and Reference Value PREPARATION

- ECM is located behind the passenger side instrument lower 1. panel. For this inspection, remove passenger side instrument lower panel.
- 2. Remove ECM harness connector.

- 3. When disconnecting ECM harness connector, loosen it with levers as far as they will go as shown in the figure.
- 4. Connect a break-out box (SST) and Y-cable adapter (SST) between the ECM and ECM harness connector.
 - Use extreme care not to touch 2 pins at one time.
 - Data is for comparison and may not be exact.

ECM INSPECTION TABLE

Specification data are reference values and are measured between each terminal and ground. Pulse signal is measured by CONSULT-II.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECMs transistor. Use a ground other than ECM terminals, such as the ground.

★: Average voltage for pulse signal (Actual pulse signal can be confirmed by oscilloscope.)

CONSULT-II Function FUNCTION

Diagnostic test mode	Function
Work support	This mode enables a technician to adjust some devices faster and more accurately by following the indications on the CONSULT-II unit.
Self-diagnostic results	Self-diagnostic results such as 1st trip DTC, DTCs and 1st trip freeze frame data or freeze frame data can be read and erased quickly.*
Data monitor	Input/Output data in the ECM can be read.
Data monitor (SPEC)	Input/Output of the specification for Basic fuel schedule, AFM, A/F feedback control value and the other data monitor items can be read.
CAN diagnostic support monitor	The results of transmit/receive diagnosis of CAN communication can be read.
Active test	Diagnostic Test Mode in which CONSULT-II drives some actuators apart from the ECMs and also shifts some parameters in a specified range.
DTC & SRT confirmation	The status of system monitoring tests and the self-diagnosis status/result can be confirmed.
Function test	This mode is used to inform customers when their vehicle condition requires periodic maintenance.
ECM part number	ECM part number can be read.

*: The following emission-related diagnostic information is cleared when the ECM memory is erased.

• Diagnostic trouble codes

- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values
- Others

X: Applicable

*1: This item includes 1st trip DTCs.

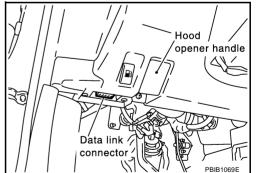

*2: This mode includes 1st trip freeze frame data or freeze frame data. The items appear on CONSULT-II screen in freeze frame data mode only if a 1st trip DTC or DTC is detected. For details, refer to <u>EC-51</u>.

INSPECTION PROCEDURE

CAUTION:

If CONSULT-II is used with no connection of CONSULT-II CONVERTER, malfunctions might be detected in self-diagnosis depending on control unit which carry out CAN communication.

- 1. Turn ignition switch OFF.
- 2. Connect "CONSULT-II" and "CONSULT-II CONVERTER" to data link connector, which is located under LH dash panel near the hood opener handle.
- 3. Turn ignition switch ON.

NISSAN	
CONSULT -II	
ENGINE	
START (NISSAN BASED VHCL)	
START (RENAULT BASED VHCL)

reeze Frame Dat	a and 1st Trip Freeze Frame Data					
Freeze frame data item*	Description					
DIAG TROUBLE CODE [PXXXX]	• The engine control component part/control system has a trouble code, it is displayed as PXXXX. (Refer to <u>EC-8, "INDEX FOR DTC"</u> .)					
FUEL SYS-B1	• "Fuel injection system status" at the moment a malfunction is detected is displayed.					
FUEL SYS-B2	 One mode in the following is displayed. Mode2: Open loop due to detected system malfunction Mode3: Open loop due to driving conditions (power enrichment, deceleration enrichment) Mode4: Closed loop - using oxygen sensor(s) as feedback for fuel control Mode5: Open loop - has not yet satisfied condition to go to closed loop 					
CAL/LD VALUE [%]	• The calculated load value at the moment a malfunction is detected is displayed.					
COOLANT TEMP [°C] or [°F]	• The engine coolant temperature at the moment a malfunction is detected is displayed.					
L-FUEL TRIM-B1 [%]	• "Long-term fuel trim" at the moment a malfunction is detected is displayed.					
L-FUEL TRIM-B2 [%]	 The long-term fuel trim indicates much more gradual feedback compensation to the base fuel schedule than short-term fuel trim. 					
S-FUEL TRIM-B1 [%] • "Short-term fuel trim" at the moment a malfunction is detected is displayed.						
S-FUEL TRIM-B2 [%]	 The short-term fuel trim indicates dynamic or instantaneous feedback compensation to the base fuel schedule. 					
ENGINE SPEED [rpm]	• The engine speed at the moment a malfunction is detected is displayed.					
VEHICL SPEED [km/ h] or [mph]	• The vehicle speed at the moment a malfunction is detected is displayed.					
B/FUEL SCHDL [msec]	• The base fuel schedule at the moment a malfunction is detected is displayed.					
INT/A TEMP SE [°C] or [°F]	• The intake air temperature at the moment a malfunction is detected is displayed.					

 $\ensuremath{^*:}$ The items are the same as those of 1st trip freeze frame data.

DATA MONITOR MODE Monitored Item

HO2S2 (B1) [V]	×		 The signal voltage of the heated oxygen sen- 			
HO2S2 (B2) [V]	×		sor 2 is displayed.			
HO2S1 MNTR (B1) [RICH/LEAN]	×	×	 Display of heated oxygen sensor 1 signal dur- ing air-fuel ratio feedback control: 	 After turning ON the ignition switch, "RICH" is displayed until air-fuel mix- 		
HO2S1 MNTR (B2) [RICH/LEAN]	×		RICH: means the mixture became "rich", and control is being affected toward a leaner mix- ture. LEAN: means the mixture became "lean", and control is being affected toward a rich mix- ture.	 When the air-fuel ratio feedback is clamped, the value just before the clamping is displayed continuously. 		
HO2S2 MNTR (B1) [RICH/LEAN]	×		• Display of heated oxygen sensor 2 signal: RICH: means the amount of oxygen after	 When the engine is stopped, a certain 		
HO2S2 MNTR (B2) [RICH/LEAN]	×		three way catalyst is relatively small. LEAN: means the amount of oxygen after three way catalyst is relatively large.	value is indicated.		
VHCL SPEED SE [km/h] or [mph]	×	×	• The vehicle speed computed from the vehicle speed signal sent from combination meter is displayed.			
BATTERY VOLT [V]	×	×	 The power supply voltage of ECM is dis- played. 			
ACCEL SEN 1 [V]	×	×	 The accelerator pedal position sensor signal voltage is displayed. 	 ACCEL SEN 2 signal is converted by ECM internally. Thus, it differ from ECM terminal voltage signal. 		
		~		THRTL SEN 2 signal is converted by		
THRTL SEN 2 [V]	×	~	 The throttle position sensor signal voltage is displayed. 	ECM internally. Thus, it differ from ECM terminal voltage signal.		
FUEL T/TEMP SE [°C] or [°F]	×		• The fuel temperature (determined by the sig- nal voltage of the fuel tank temperature sen- sor) is displayed.			
INT/A TEMP SE [°C] or [°F]	×	×	• The intake air temperature (determined by the signal voltage of the intake air temperature sensor) is indicated.			
EVAP SYS PRES [V]	×		• The signal voltage of EVAP control system pressure sensor is displayed.			
FUEL LEVEL SE [V]	×		 The signal voltage of the fuel level sensor is displayed. 			

Monitored item [Unit]	ECM INPUT SIG- NALS	MAIN SIG- NALS	Description	Remarks	А
START SIGNAL [ON/OFF]	×	×	 Indicates start signal status [ON/OFF] com- puted by the ECM according to the signals of engine speed and battery voltage. 	 After starting the engine, [OFF] is dis- played regardless of the starter signal. 	EC
CLSD THL POS [ON/OFF]	×	×	 Indicates idle position [ON/OFF] computed by ECM according to the accelerator pedal posi- tion sensor signal. 		С
AIR COND SIG [ON/OFF]	×	×	 Indicates [ON/OFF] condition of the air condi- tioner switch as determined by the air condi- tioner signal. 		D
P/N POSI SW [ON/OFF]	×	×	 Indicates [ON/OFF] condition from the park/ neutral position (PNP) switch signal. 		Е
PW/ST SIGNAL [ON/OFF]	×	×	• [ON/OFF] condition of the power steering system (determined by the signal voltage of the power steering pressure sensor signal) is indicated.		F
LOAD SIGNAL [ON/OFF]	×	×	 Indicates [ON/OFF] condition from the electrical load signal. ON: Rear window defogger switch is ON and/ or lighting switch is in 2nd position. OFF: Both rear window defogger switch and lighting switch are OFF. 		G
IGNITION SW [ON/OFF]	×		 Indicates [ON/OFF] condition from ignition switch signal. 		
HEATER FAN SW [ON/OFF]	×		 Indicates [ON/OFF] condition from the heater fan switch signal. 		
BRAKE SW [ON/OFF]			 Indicates [ON/OFF] condition from the stop lamp switch signal. 		J
INJ PULSE-B1 [msec] INJ PULSE-B2		×	 Indicates the actual fuel injection pulse width compensated by ECM according to the input signals. 	 When the engine is stopped, a certain computed value is indicated. 	K
[msec] IGN TIMING [BTDC]		×	 Indicates the ignition timing computed by ECM according to the input signals. 	 When the engine is stopped, a certain value is indicated. 	L
CAL/LD VALUE [%]			• "Calculated load value" indicates the value of the current air flow divided by peak air flow.		
MASS AIRFLOW [g·m/s]			• Indicates the mass air flow computed by ECM according to the signal voltage of the mass air flow sensor.		Μ
PURG VOL C/V [%]			 Indicates the EVAP canister purge volume control solenoid valve control value computed by the ECM according to the input signals. The opening becomes larger as the value increases. 		
INT/V TIM (B1) [°CA]			Indicates [°CA] of intake camshaft advanced		
INT/V TIM (B2) [°CA]			angle.		
INT/V SOL (B1) [%]			 The control value of the intake valve timing control solenoid valve (determined by ECM 		
INT/V SOL (B2) [%]			 The advance angle becomes larger as the value increases. 		

Monitored item [Unit]	ECM INPUT SIG- NALS	MAIN SIG- NALS	Description	Remarks
AIR COND RLY [ON/OFF]		×	• The air conditioner relay control condition (determined by ECM according to the input signals) is indicated.	
FUEL PUMP RLY [ON/OFF]		×	 Indicates the fuel pump relay control condi- tion determined by ECM according to the input signals. 	
VENT CONT/V [ON/OFF]			 The control condition of the EVAP canister vent control valve (determined by ECM according to the input signals) is indicated. ON: Closed OFF: Open 	
THRTL RELAY [ON/OFF]			• Indicates the throttle control motor relay con- trol condition determined by the ECM accord- ing to the input signals.	
COOLING FAN [HI/LOW/OFF]			 The control condition of the cooling fan (determined by ECM according to the input signals) is indicated. HI: High speed operation LOW: Low speed operation OFF: Stop 	
HO2S1 HTR (B1) [ON/OFF] HO2S1 HTR (B2) [ON/OFF]			 Indicates [ON/OFF] condition of heated oxy- gen sensor 1 heater determined by ECM according to the input signals. 	
HO2S2 HTR (B1) [ON/OFF] HO2S2 HTR (B2)			 Indicates [ON/OFF] condition of heated oxy- gen sensor 2 heater determined by ECM according to the input signals. 	
[ON/OFF] I/P PULLY SPD [rpm]			 Indicates the engine speed computed from the turbine revolution sensor signal. 	
VEHICLE SPEED [km/h] or [MPH]			• The vehicle speed computed from the vehicle speed signal sent from TCM or combination meter is displayed.	
IDL A/V LEARN [YET/CMPLT]			 Display the condition of idle air volume learn- ing YET: Idle air volume learning has not been performed yet. CMPLT: Idle air volume learning has already been performed successfully. 	
TRVL AFTER MIL [km] or [mile]			• Distance traveled while MIL is activated.	
O2SEN HTR DTY [%]			 Indicates the heated oxygen sensor 1 heater control value computed by the ECM accord- ing to the input signals. 	
AC PRESS SEN [V]			• The signal voltage from the refrigerant pres- sure sensor is displayed.	
VHCL SPEED SE [km/h] or [mph]			• The vehicle speed computed from the vehicle speed signal sent from combination meter is displayed.	
SET VHCL SPD [km/h] or [mph]			• The preset vehicle speed is displayed.	
MAIN SW [ON/OFF]			 Indicates [ON/OFF] condition from CRUISE switch signal. 	

Revision: 2004 November

Monitored item [Unit]	ECM INPUT SIG- NALS	MAIN SIG- NALS	Description	Remarks	А
CANCEL SW [ON/OFF]			 Indicates [ON/OFF] condition from CANCEL switch signal. 		EC
RESUME/ACC SW [ON/OFF]			 Indicates [ON/OFF] condition from ACCEL/ RES switch signal. 		С
SET SW [ON/OFF]			 Indicates [ON/OFF] condition from COAST/ SET switch signal. 		0
BRAKE SW1 [ON/OFF]			 Indicates [ON/OFF] condition from ASCD brake switch signal, and ASCD clutch switch signal (M/T models). 		D
BRAKE SW2 [ON/OFF]			 Indicates [ON/OFF] condition of stop lamp switch signal. 		Е
VHCL SPD CUT [NON/CUT]			 Indicates the vehicle cruise condition. NON: Vehicle speed is maintained at the ASCD set speed. CUT: Vehicle speed increased to excessively high compared with the ASCD set speed, and ASCD operation is cut off. 		F
LO SPEED CUT [NON/CUT]			 Indicates the vehicle cruise condition. NON: Vehicle speed is maintained at the ASCD set speed. CUT: Vehicle speed decreased to excessively low compared with the ASCD set speed, and ASCD operation is cut off. 		Н
AT OD MONITOR [ON/OFF]			 Indicates [ON/OFF] condition of A/T O/D according to the input signal from the TCM. 	 For M/T models always "OFF" is dis- played. 	I
AT OD CANCEL [ON/OFF]			 Indicates [ON/OFF] condition of A/T O/D can- cel signal sent from the TCM. 	 For M/T models always "OFF" is dis- played. 	J
CRUISE LAMP [ON/OFF]			 Indicates [ON/OFF] condition of CRUISE lamp determined by the ECM according to the input signals. 		K
SET LAMP [ON/OFF]			 Indicates [ON/OFF] condition of SET lamp determined by the ECM according to the input signals. 		L
Voltage [V]					
Frequency [msec], [Hz] or [%]				 Only "#" is displayed if item is unable to be measured. 	M
DUTY-HI			• Voltage, frequency, duty cycle or pulse width	• Figures with "#"s are temporary ones.	
DUTY-LOW			measured by the probe.	They are the same figures as an actual piece of data which was just previously	
PLS WIDTH-HI				measured.	
PLS WIDTH-LOW					

NOTE:

Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

DATA MONITOR (SPEC) MODE Monitored Item

Monitored item [Unit]	ECM INPUT SIGNALS	MAIN SIGNALS	Description	Remarks
ENG SPEED [rpm]	×	×	• Indicates the engine speed computed from the signal of the crankshaft position sensor (POS) and camshaft position sensor (PHASE).	
MAS A/F SE-B1 [V]	×	×	• The signal voltage of the mass air flow sensor specification is displayed.	• When engine is running specification range is indicated.
B/FUEL SCHDL [msec]		×	 "Base fuel schedule" indicates the fuel injection pulse width programmed into ECM, prior to any learned on board cor- rection. 	 When engine is running specification range is indicated.
A/F ALPHA-B1 [%] A/F ALPHA-B2 [%]		×	• The mean value of the air-fuel ratio feed- back correction factor per cycle is indi- cated.	 When engine is running specification range is indicated. This data also includes the data for the air-fuel ratio learning control.

NOTE:

Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

REAL TIME DIAGNOSIS IN DATA MONITOR MODE (RECORDING VEHICLE DATA) Description

CONSULT-II has two kinds of triggers and they can be selected by touching "SETTING" in "DATA MONITOR" mode.

- 1. "AUTO TRIG" (Automatic trigger):
 - The malfunction will be identified on the CONSULT-II screen in real time.

In other words, DTC/1st trip DTC and malfunction item will be displayed if the malfunction is detected by ECM.

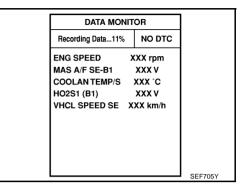

At the moment a malfunction is detected by ECM, "MONI-TOR" in "DATA MONITOR" screen is changed to "Recording Data ... xx%" as shown at right, and the data after the malfunction detection is recorded. Then when the percentage reached 100%, "REAL-TIME DIAG" screen is displayed. If "STOP" is touched on the screen during "Recording Data ... xx%", "REAL-TIME DIAG" screen is also displayed.

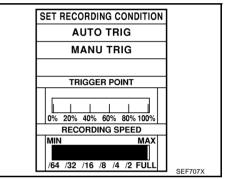

The recording time after the malfunction detection and the recording speed can be changed by "TRIGGER POINT" and "Recording Speed". Refer to CONSULT-II OPERATION MAN-UAL.

2. "MANU TRIG" (Manual trigger):

• DTC/1st trip DTC and malfunction item will not be displayed automatically on CONSULT-II screen even though a malfunction is detected by ECM.

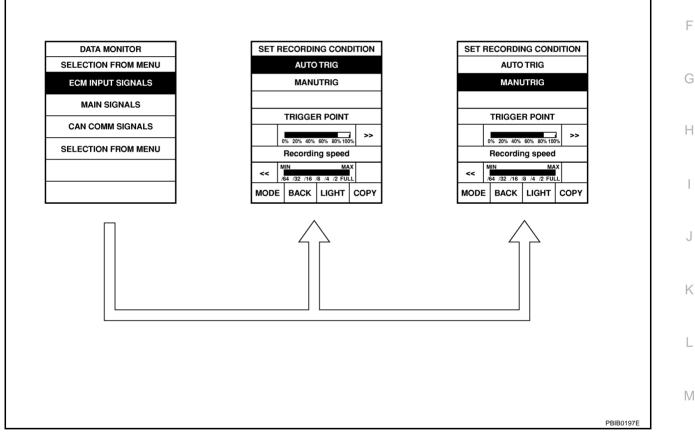

DATA MONITOR can be performed continuously even though a malfunction is detected.

Operation

- 1. "AUTO TRIG"
 - While trying to detect the DTC/1st trip DTC by performing the DTC Confirmation Procedure, be sure to select to "DATA MONITOR (AUTO TRIG)" mode. You can confirm the malfunction at the moment it is detected.
 - While narrowing down the possible causes, CONSULT-II should be set in "DATA MONITOR (AUTO TRIG)" mode, especially in case the incident is intermittent. When you are inspecting the circuit by gently shaking (or twisting) the suspicious connectors, components and harness in the DTC Confirmation Procedure, the moment a malfunction is found the DTC/1st trip DTC will be displayed. (Refer to INCIDENT SIMULATION TESTS in <u>GI-27, "How to Perform Efficient Diagnosis for an Electrical Incident"</u>.)
- 2. "MANU TRIG"
 - If the malfunction is displayed as soon as "DATA MONITOR" is selected, reset CONSULT-II to "MANU TRIG". By selecting "MANU TRIG" you can monitor and store the data. The data can be utilized for further diagnosis, such as a comparison with the value for the normal operating condition.

Generic Scan Tool (GST) Function DESCRIPTION

Generic Scan Tool (OBDII scan tool) complying with SAE J1978 has 8 different functions explained below.

ISO9141 is used as the protocol.

The name "GST" or "Generic Scan Tool" is used in this service manual.

ABS000S5

А

EC

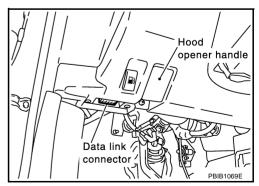

F

FUNCTI	ON
--------	----

Di	iagnostic test mode	Function
MODE 1	READINESS TESTS	This mode gains access to current emission-related data values, including analog inputs and outputs, digital inputs and outputs, and system status information.
MODE 2	(FREEZE DATA)	This mode gains access to emission-related data value which were stored by ECM during the freeze frame. For details, refer to EC-51, "FREEZE FRAME DATA AND 1ST TRIP FREEZE FRAME DATA".
MODE 3	DTCs	This mode gains access to emission-related power train trouble codes which were stored by ECM.
		This mode can clear all emission-related diagnostic information. This includes:
		Clear number of diagnostic trouble codes (MODE 1)
		Clear diagnostic trouble codes (MODE 3)
MODE 4	CLEAR DIAG INFO	• Clear trouble code for freeze frame data (MODE 1)
		• Clear freeze frame data (MODE 2)
		• Reset status of system monitoring test (MODE 1)
		• Clear on board monitoring test results (MODE 6 and 7)
MODE 6	(ON BOARD TESTS)	This mode accesses the results of on board diagnostic monitoring tests of specific com- ponents/systems that are not continuously monitored.
MODE 7	(ON BOARD TESTS)	This mode enables the off board test drive to obtain test results for emission-related pow- ertrain components/systems that are continuously monitored during normal driving condi- tions.
		This mode can close EVAP system in ignition switch ON position (Engine stopped). When this mode is performed, the following parts can be opened or closed.
		• EVAP canister vent control valve open
		In the following conditions, this mode cannot function.
		Low ambient temperature
MODE 8	_	Low battery voltage
		Engine running
		Ignition switch OFF
		Low fuel temperature
		• Too much pressure is applied to EVAP system
MODE 9	(CALIBRATION ID)	This mode enables the off-board test device to request specific vehicle information such as Vehicle Identification Number (VIN) and Calibration IDs.

INSPECTION PROCEDURE

- 1. Turn ignition switch OFF.
- 2. Connect "GST" to data link connector, which is located under LH dash panel near the hood opener handle.

Turn ignition switch ON. 3. А 4. Enter the program according to instruction on the screen or in the operation manual. VTX GENERIC OBD II (*: Regarding GST screens in this section, sample screens are PROGRAM CARD shown.) EC С Press [ENTER] Sample screen* SEF398S D 5. CONSULT-II Reference Value in Data Monitor

ABS000S6

Remarks:

- Specification data are reference values.

Specification data are reference values.
 Specification data are output/input values which are detected or supplied by the ECM at the connector.
 * Specification data may not be directly related to their components signals/values/operations.

 i.e. Adjust ignition timing with a timing light before monitoring IGN TIMING, because the monitor may show the specification data in spite of the ignition timing not being adjusted to the specification data. This IGN TIMING monitors the data calculated by the ECM according to the signals input from the camshaft position sensor and other ignition timing related sensors.

MONITOR ITEM	100	NDITION	SPECIFICATION

Major Sensor Reference Graph in Data Monitor Mode

The following are the major sensor reference graphs in "DATA MONITOR" mode.

CLSD THL POS, ACCEL SEN 1, THRTL SEN 1

Below is the data for "CLSD THL POS", "ACCEL SEN 1" and "THRTL SEN 1" when depressing the accelerator pedal with the ignition switch ON and with selector lever in D position (A/T), 1st position (M/T).

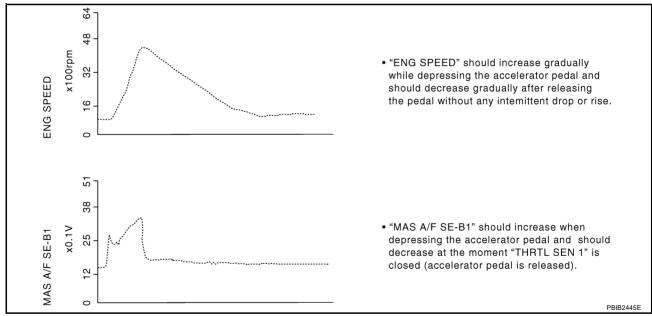

The signal of "ACCEL SEN 1" and "THRTL SEN 1" should rise gradually without any intermittent drop or rise after "CLSD THL POS" is changed from "ON" to "OFF".

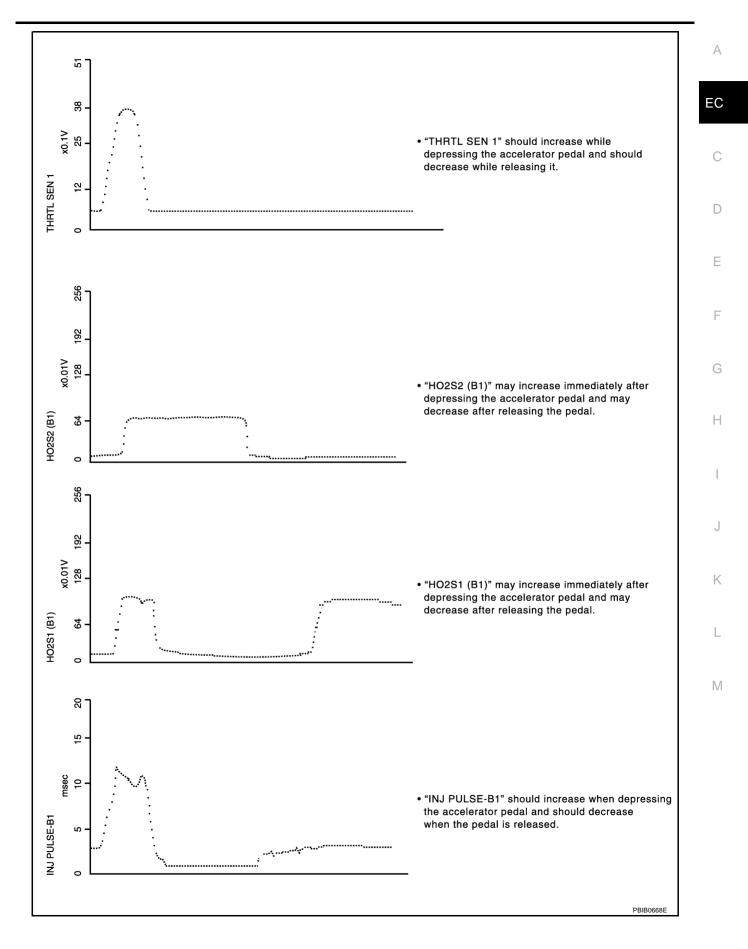

ENG SPEED, MAS A/F SE-B1, THRTL SEN 1, HO2S2 (B1), HO2S1 (B1), INJ PULSE-B1

Below is the data for "ENG SPEED", "MAS A/F SE-B1", "THRTL SEN 1", "HO2S2 (B1)", "HO2S1 (B1)" and "INJ PULSE-B1" when revving engine quickly up to 4,800 rpm under no load after warming up engine sufficiently.

Each value is for reference, the exact value may vary.

ABS000S7

TROUBLE DIAGNOSIS - SPECIFICATION VALUE

Description

The specification (SP) value indicates the tolerance of the value that is displayed in "DATA MONITOR (SPEC)" mode of CONSULT-II during normal operation of the Engine Control System. When the value in "DATA MONI-TOR (SPEC)" mode is within the SP value, the Engine Control System is confirmed OK. When the value in "DATA MONITOR (SPEC)" mode is NOT within the SP value, the Engine Control System may have one or more malfunctions.

The SP value is used to detect malfunctions that may affect the Engine Control System, but will not light the MIL.

The SP value will be displayed for the following three items:

- B/FUEL SCHDL (The fuel injection pulse width programmed into ECM prior to any learned on board correction)
- A/F ALPHA-B1/B2 (The mean value of air-fuel ratio feedback correction factor per cycle)
- MAS A/F SE-B1 (The signal voltage of the mass air flow sensor)

Testing Condition

- Vehicle driven distance: More than 5,000 km (3,017 miles)
- Barometric pressure: 98.3 104.3 kPa (1.003 1.064 kg/cm², 14.25 15.12 psi)
- Atmospheric temperature: 20 30°C (68 86°F)
- Engine coolant temperature: 75 95°C (167 203°F)
- Transmission: Warmed-up*1
- Electrical load: Not applied*²
- Engine speed: Idle

*1: For A/T models, after the engine is warmed up to normal operating temperature, drive vehicle until "FLUID TEMP SE" (A/T fluid temperature sensor signal) indicates more than 60°C (140°F).

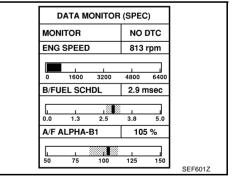

For M/T models, after the engine is warmed up to normal operating temperature, drive vehicle for 5 minutes. *2: Rear window defogger switch, air conditioner switch, lighting switch are OFF. Steering wheel is straight ahead.

Inspection Procedure

NOTE:

Perform "DATA MONITOR (SPEC)" mode in maximum scale display.

- 1. Perform EC-77, "Basic Inspection".
- 2. Confirm that the testing conditions indicated above are met.
- Select "B/FUEL SCHDL", "A/F ALPHA-B1", "A/F ALPHA-B2" and "MAS A/F SE-B1" in "DATA MONITOR (SPEC)" mode with CONSULT-II.
- 4. Make sure that monitor items are within the SP value.
- 5. If NG, go to EC-125, "Diagnostic Procedure" .

ABS000SA

Revision: 2004 November

TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT

Description

Intermittent incidents (I/I) may occur. In many cases, the malfunction resolves itself (the part or circuit function returns to normal without intervention). It is important to realize that the symptoms described in the customer's complaint often do not recur on (1st trip) DTC visits. Realize also that the most frequent cause of I/I occurrences is poor electrical connections. Because of this, the conditions under which the incident occurred may not be clear. Therefore, circuit checks made as part of the standard diagnostic procedure may not indicate the specific malfunctioning area.

Common I/I Report Situations

STEP in Work Flow	Situation
II	The CONSULT-II is used. The SELF-DIAG RESULTS screen shows time data other than [0] or [1t].
III	The symptom described by the customer does not recur.
IV	(1st trip) DTC does not appear during the DTC Confirmation Procedure.
VI	The Diagnostic Procedure for PXXXX does not indicate the malfunctioning area.

Diagnostic Procedure

1. INSPECTION START

Erase (1st trip) DTCs. Refer to EC-60, "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMA-TION".

>> GO TO 2.

2. CHECK GROUND TERMINALS

Check ground terminals for corroding or loose connection. Refer to <u>GI-27, "How to Perform Efficient Diagnosis for an Electrical Incident"</u>, "CIRCUIT INSPECTION", "Ground Inspection".

OK or NG

OK >> GO TO 3.

NG >> Repair or replace.

3. SEARCH FOR ELECTRICAL INCIDENT

Perform <u>GI-27, "How to Perform Efficient Diagnosis for an Electrical Incident"</u>, "INCIDENT SIMULATION TESTS".

OK or NG

OK >> GO TO 4. NG >> Repair or replace.

4. CHECK CONNECTOR TERMINALS

Refer to <u>GI-24, "How to Check Terminal"</u>, "HOW TO PROBE CONNECTORS", "How to Check Enlarged Contact Spring of Terminal".

OK or NG

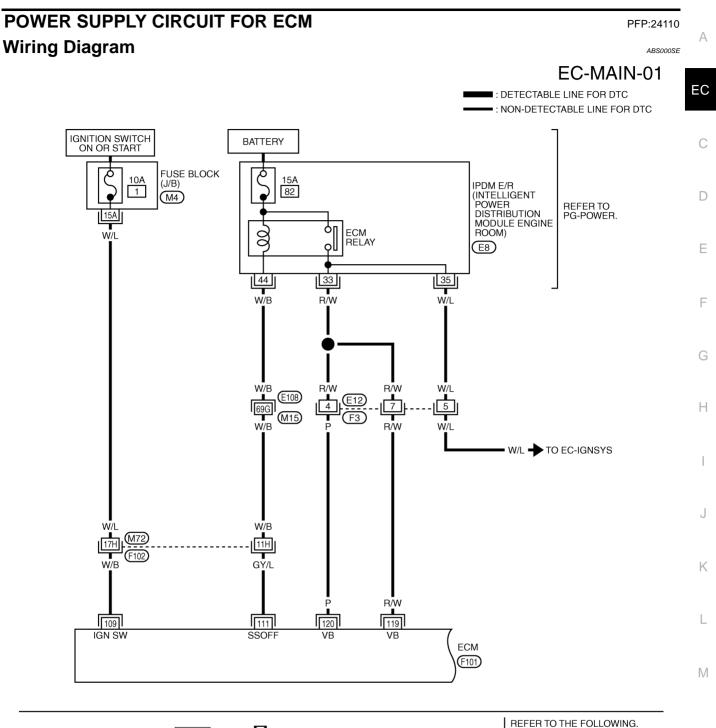

OK >> INSPECTION END

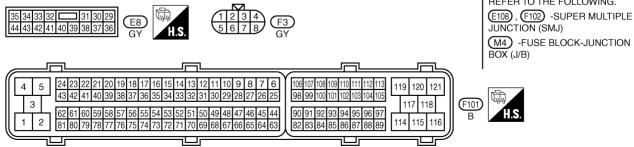

NG >> Repair or replace connector.

PFP:00006

ABS000SC

ABS000SD

TBWT0470E

Specification data are reference values and are measured between each terminal and ground.

CAUTION:

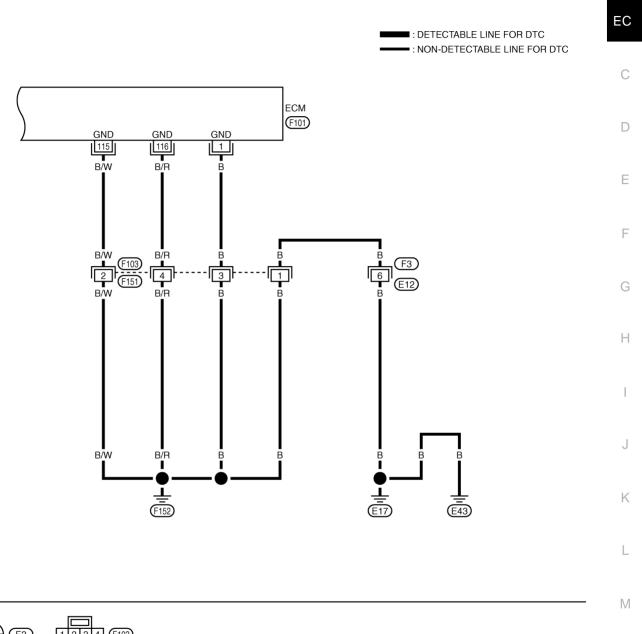

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

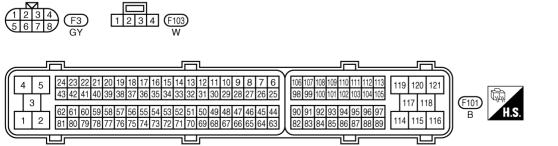

TER- MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
			[Ignition switch: OFF]	OV
109	W/B	Ignition switch	[Ignition switch: ON]	BATTERY VOLTAGE (11 - 14V)
			[Engine is running] [Ignition switch: OFF]	0.451
111	GY/L	ECM relay	 For a few seconds after turning ignition switch OFF 	0 - 1.5V
		(Self shut-off)	[Ignition switch: OFF]	
			 A few seconds passed after turning ignition switch OFF 	BATTERY VOLTAGE (11 - 14V)
119 120	R/W P	Power supply for ECM	[Ignition switch: ON]	BATTERY VOLTAGE (11 - 14V)

А

TBWT0471E

Specification data are reference values and are measured between each terminal and ground.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

TER- MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
1	В	ECM ground	[Engine is running] • Idle speed	Engine ground
115 116	B/W B/R	ECM ground	[Engine is running] • Idle speed	Engine ground

Diagnostic Procedure

1. INSPECTION START

Start engine.

Is engine running?

Yes or No

Yes >> GO TO 7. No >> GO TO 2.

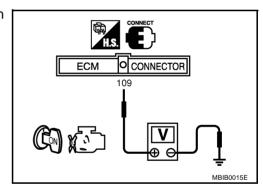

2. CHECK ECM POWER SUPPLY CIRCUIT-I

- 1. Turn ignition switch OFF and then ON.
- 2. Check voltage between ECM terminal 109 and ground with CONSULT-II or tester.

Voltage: Battery voltage

OK or NG

OK >> GO TO 4. NG >> GO TO 3.

3. DETECT MALFUNCTIONING PART

Check the following.

- Harness connectors M72, F102
- Fuse block (J/B) connector M4
- 10A fuse
- Harness for open or short between ECM and fuse

>> Repair harness or connectors.

ABS000SF

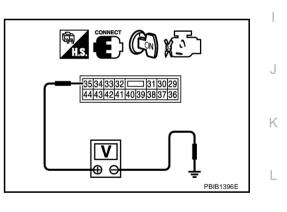

POWER SUPPLY CIRCUIT FOR ECM

4. CHECK ECM GROUND CIRCUIT FOR OPEN AND SHORT-I	A
 Turn ignition switch OFF. Disconnect ECM harness connector. Check harness continuity between ECM terminals 1, 115, 116 and engine ground. Refer to Wiring Diagram. 	EC
Continuity should exist. 4. Also check harness for short to power.	С
<u>OK or NG</u> OK >> GO TO 6. NG >> GO TO 5.	D
5. DETECT MALFUNCTIONING PART	Е
 Check the following. Harness connectors F103, F151 Harness connectors F3, E12 Harness for open or short between ECM and engine ground 	F
>> Repair open circuit or short to power in harness or connectors.	G
6. CHECK ECM POWER SUPPLY CIRCUIT-II	Н

- 1. Reconnect ECM harness connector.
- 2. Turn ignition switch ON.
- 3. Check voltage between IPDM E/R terminal 35 and ground with CONSULT-II or tester.

Voltage: Battery voltage

- OK or NG
 - OK >> Go to EC-572, "IGNITION SIGNAL".
 - NG >> GO TO 7.

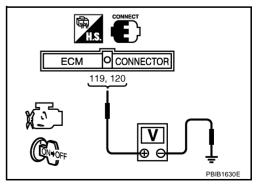

7. CHECK ECM POWER SUPPLY CIRCUIT-III

- 1. Turn ignition switch ON and then OFF.
- 2. Check voltage between ECM terminals 119, 120 and ground with CONSULT-II or tester.

Voltage: After turning ignition switch OFF, battery voltage will exist for a few seconds, then drop approximately 0V.

OK or NG

- OK >> GO TO 16.
- NG (Battery voltage does not exist.)>>GO TO 8.
- NG (Battery voltage exists for more than a few seconds.)>>GO TO 16.

Μ

8. CHECK ECM POWER SUPPLY CIRCUIT-V

- 1. Turn ignition switch OFF.
- 2. Check voltage between ECM terminal 111 and ground with CONSULT-II or tester.

Voltage: Battery voltage

OK or NG

OK >> GO TO 9. NG >> GO TO 11.

9. CHECK ECM POWER SUPPLY CIRCUIT-VI

- 1. Disconnect ECM harness connector.
- 2. Disconnect IPDM E/R harness connector E8.
- 3. Check harness continuity between ECM terminals 119, 120 and IPDM E/R terminal 33. Refer to Wiring Diagram.

Continuity should exist.

4. Also check harness for short to ground and short to power.

OK or NG

OK >> GO TO 14. NG >> GO TO 10.

10. DETECT MALFUNCTIONING PART

Check the following.

- Harness or connectors E12, F3
- Harness for open or short between ECM and IPDM E/R

>> Repair open circuit or short to ground or short to power in harness or connectors.

11. CHECK ECM POWER SUPPLY CIRCUIT-VII

- 1. Disconnect ECM harness connector.
- 2. Disconnect IPDM E/R harness connector.
- 3. Check harness continuity between ECM terminal 111 and IPDM E/R terminal 44. Refer to Wiring Diagram.

Continuity should exist.

4. Also check harness for short to ground and short to power.

OK or NG

OK >> GO TO 13. NG >> GO TO 12.

POWER SUPPLY CIRCUIT FOR ECM

12. DETECT MALFUNCTIONING PART	Δ
 Check the following. Harness or connectors E108, M15 Harness or connectors M72, F102 Harness for open or short between ECM and IPDM E/R 	EC
>> Repair open circuit or short to ground or short to power in harness or connectors.	С
13. CHECK 15A FUSE	
 Disconnect 15A fuse from IPDM E/R. Check 15A fuse. OK or NG 	D
OK 01 NG OK >> GO TO 16. NG >> Replace 15A fuse.	F
14. CHECK ECM GROUND CIRCUIT FOR OPEN AND SHORT-II	Г
 Turn ignition switch OFF. Disconnect ECM harness connector. Check harness continuity between ECM terminals 1, 115, 116 and engine ground. Refer to Wiring Diagram. 	G
Continuity should exist.	
 4. Also check harness for short to power. <u>OK or NG</u> OK >> GO TO 16. NG >> GO TO 15. 	I
15. DETECT MALFUNCTIONING PART	J
 Check the following. Harness or connectors F103, F151 Harness or connectors F3, E12 Harness for open or short between ECM and engine ground. 	K
>> Repair open circuit or short to ground or short to power in harness or connectors.	
16. CHECK INTERMITTENT INCIDENT	Μ
Refer to EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT".	

OK or NG

OK >> Replace IPDM E/R. Refer to <u>PG-17, "IPDM E/R (INTELLIGENT POWER DISTRIBUTION MOD-ULE ENGINE ROOM)"</u>.

NG >> Repair open circuit or short to ground or short to power in harness or connectors.

DTC U1000, U1001 CAN COMMUNICATION LINE

Description

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only.

On Board Diagnosis Logic

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
U1000* ¹ 1000* ¹ U1001* ² 1001* ²	CAN communication line	 ECM cannot communicate to other control units. ECM cannot communicate for more than the specified time. 	 Harness or connectors (CAN communication line is open or shorted)

*1: This self-diagnosis has the one trip detection logic.

*2: The MIL will not light up for this diagnosis.

DTC Confirmation Procedure

- 1. Turn ignition switch ON and wait at least 3 seconds.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. If 1st trip DTC is detected, go to EC-138, "Diagnostic Procedure" .

TBWT0193E

Diagnostic Procedure

Go to LAN-2, "Precautions When Using CONSULT-II" .

This mechanism hydraulically controls cam phases continuously with the fixed operating angle of the intake valve.

The ECM receives signals such as crankshaft position, camshaft position, engine speed, and engine coolant temperature. Then, the ECM sends ON/OFF pulse duty signals to the intake valve timing control solenoid valve depending on driving status. This makes it possible to control the shut/open timing of the intake valve to increase engine torque in low/mid speed range and output in high-speed range.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

On Board Diagnosis Logic

DTC No.	Trouble diagnosis name	Detecting condition	Possible cause
P0011 0011 (Bank 1)	Intake valve timing	There is a gap between angle of target and	 Crankshaft position sensor (POS) Camshaft position sensor (PHASE)
P0021 0021 (Bank 2)	control performance	phase-control angle degree.	 Accumulation of debris to the signal pick-up portion of the camshaft

FAIL-SAFE MODE

When the malfunction is detected, the ECM enters fail-safe mode.

Detected items	Engine operating condition in fail-safe mode
Intake valve timing control	The signal is not energized to the solenoid valve and the valve control does not function.

DTC Confirmation Procedure

CAUTION:

Always drive at a safe speed.

NOTE:

- If DTC P0011 or P0021 is displayed with DTC P1111 or P1136, first perform trouble diagnosis for DTC P1111 or P1136. Refer to <u>EC-401</u>.
- If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is between 10V and 16V at idle.

WITH CONSULT-II

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 2. Start engine and warm it up to the normal operating temperature.
- Maintain the following conditions for at least 6 consecutive seconds.

Hold the accelerator pedal as steady as possible.

VHCL SPEED SE	100 - 120 km/h (63 - 75 MPH)
ENG SPEED	2,000 - 4,000 rpm
COOLAN TEMP/S	60 - 120°C (140 - 248°F)
B/FUEL SCHDL	More than 7.26 msec
Selector lever	A/T models: D position M/T models: 5th position

DATA MO	NIT	OR
MONITOR		NO DTC
ENG SPEED B/FUEL SCHDL		XX rpm XX msec
COOLAN TENP/S		XXX °C
VHCL SPEED SE INT/V TIM (B1)		XX km/h (XX °CA
INT/V TIM (B2) INT/V SOL (B1)		XXX °CA XXX %
INT/V SOL (B1) INT/V SOL (B2)		XXX % XXX %

- 4. Stop vehicle with engine running and let engine idle for 10 seconds.
- 5. If 1st trip DTC is detected, go to <u>EC-141, "Diagnostic Procedure"</u>. If 1st trip DTC is not detected, go to next step.
- 6. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	1,700 - 3,175 rpm (A constant rotation is maintained.)
COOLANT TEMPS	70 - 105°C (158 - 221°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

7. If the 1st trip DTC is detected, go to EC-141, "Diagnostic Procedure" .

DTC Confirmation Procedure

NOTE:

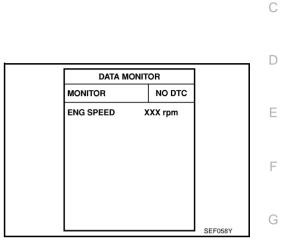

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is between 10.5V and 16V at idle.

WITH CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 4. Start engine and run it for at least 6 seconds at idle speed.
- 5. If 1st trip DTC is detected, go to EC-147, "Diagnostic Procedure"

ABS000SW

А

EC

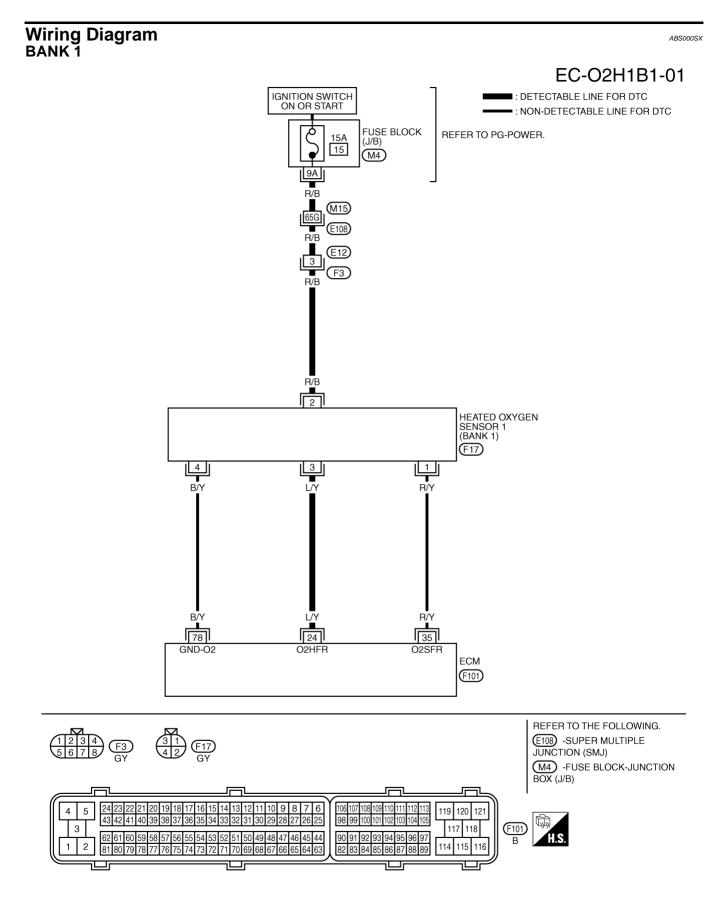

WITH GST

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Start engine and run it for at least 6 seconds at idle speed.
- 4. Turn ignition switch OFF and wait at least 10 seconds.
- 5. Start engine and run it for at least 6 seconds at idle speed.
- 6. Select "MODE 3" with GST.
- 7. If DTC is detected, go to EC-147, "Diagnostic Procedure" .
- When using GST, DTC Confirmation Procedure should be performed twice as much as when using CONSULT-II because GST cannot display MODE 7 (1st trip DTC) concerning this diagnosis. Therefore, using CONSULT-II is recommended.

DTC P0101 MAF SENSOR

Component Description

The mass air flow sensor is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. The mass air flow sensor controls the temperature of the hot wire to a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The more air, the greater the heat loss.

Therefore, the electric current supplied to hot wire is changed to maintain the temperature of the hot wire as air flow increases. The ECM detects the air flow by means of this current change.

Mass air flow sensor (O) Intake air temperature sensor PBIB1604E

DTC Confirmation Procedure

Perform PROCEDURE FOR MALFUNCTION A first.

If the DTC cannot be confirmed, perform PROCEDURE FOR MALFUNCTION B.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

PROCEDURE FOR MALFUNCTION A

NOTE:

If engine will not start or stops soon, wait at least 10 seconds with engine stopped (Ignition switch ON) instead of running engine at idle speed.

With CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Start engine and warm it up to normal operating temperature.
- 4. Run engine for at least 10 seconds at idle speed.
- 5. If DTC is detected, go to EC-162, "Diagnostic Procedure" .

Component Inspection MASS AIR FLOW SENSOR

- Reconnect all harness connectors disconnected. 1.
- 2. Start engine and warm it up to normal operating temperature.
- 3. Check voltage between ECM terminal 51 (Mass air flow sensor signal) and ground.

Condition	Voltage V
Ignition switch ON (Engine stopped.)	Approx. 0.4
Idle (Engine is warmed-up to normal operating temperature.)	0.9 - 1.2
2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.6 - 1.9
Idle to about 4,000 rpm*	1.6 - 1.9 to Approx. 2.4

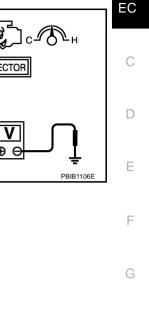

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

- 4. If the voltage is out of specification, proceed the following.
 - Turn ignition switch OFF.
 - Disconnect mass air flow sensor harness connector and reconnect it again.
 - Perform steps 2 and 3 again.
- If NG, remove mass air flow sensor from air duct. Check hot wire for damage or dust. 5.
- 6. If NG, clean or replace mass air flow sensor.

Removal and Installation MASS AIR FLOW SENSOR

Revision: 2004 November

DTC P0102, P0103 MAF SENSOR

Component Description

The mass air flow sensor is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. The mass air flow sensor controls the temperature of the hot wire to a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The more air, the greater the heat loss.

Therefore, the electric current supplied to hot wire is changed to maintain the temperature of the hot wire as air flow increases. The ECM detects the air flow by means of this current change.

Intake air temperature sensor

Mass air flow sensor

ABS000TK

CONSULT-II Reference Value in Data M	Monitor Mode
--------------------------------------	--------------

Specification data are reference values.

MONITOR ITEM	COM	SPECIFICATION	
MAS A/F SE-B1	See EC-124, "TROUBLE DIAGNOSIS - SPECIFICATION VALUE" .		
	Engine: After warming up	Idle	5% - 35%
CAL/LD VALUE	 Shift lever: N (A/T), Neutral (M/T) Air conditioner switch: OFF No-load 	2,500 rpm	5% - 35%
	Engine: After warming up	Idle	2.0 - 6.0 g⋅m/s
MASS AIRFLOW	 Shift lever: N (A/T), Neutral (M/T) Air conditioner switch: OFF No-load 	2,500 rpm	7.0 - 20.0 g⋅m/s

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0102 0102	Mass air flow sensor circuit low input	An excessively low voltage from the sensor is sent to ECM.	 Harness or connectors (The sensor circuit is open or shorted.) Intake air leaks Mass air flow sensor
P0103 0103	Mass air flow sensor circuit high input	An excessively high voltage from the sensor is sent to ECM.	 Harness or connectors (The sensor circuit is open or shorted.) Mass air flow sensor

FAIL-SAFE MODE

When the malfunction is detected, the ECM enters fail-safe mode and the MIL lights up.

Detected items	Engine operating condition in fail-safe mode
Mass air flow sensor circuit	Engine speed will not rise more than 2,400 rpm due to the fuel cut.

DTC Confirmation Procedure

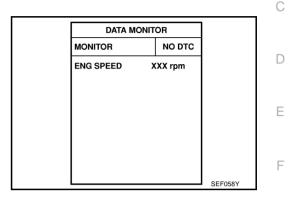

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

PROCEDURE FOR DTC P0102

(I) With CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Start engine and wait at least 5 seconds.
- 4. If DTC is detected, go to EC-169, "Diagnostic Procedure" .

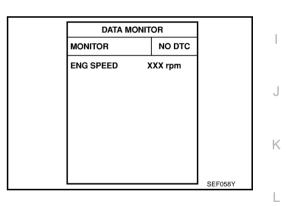

With GST

Follow the procedure "With CONSULT-II" above.

PROCEDURE FOR DTC P0103

With CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Wait at least 5 seconds.
- 4. If DTC is detected, go to <u>EC-169</u>, "Diagnostic Procedure". If DTC is not detected, go to next step.
- 5. Start engine and wait at least 5 seconds.
- 6. If DTC is detected, go to EC-169, "Diagnostic Procedure" .

With GST

Follow the procedure "With CONSULT-II" above.

ABS000TO

DTC P0112, P0113 IAT SENSOR

Component Description

The intake air temperature sensor is built-into mass air flow sensor. The sensor detects intake air temperature and transmits a signal to the ECM.

The temperature sensing unit uses a thermistor which is sensitive to the change in temperature. Electrical resistance of the thermistor decreases in response to the temperature rise.

<Reference data>

Intake air temperature °C (°F)	Voltage* V	Resistance $k\Omega$
25 (77)	3.32	1.94 - 2.06
80 (176)	1.23	0.295 - 0.349

*: These data are reference values and are measured between ECM terminal 34 (Intake air temperature sensor) and ground.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

On Board Diagnosis Logic

DTC P0117, P0118 ECT SENSOR

Component Description

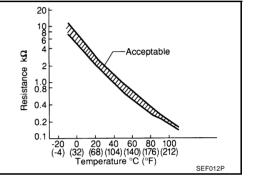

The engine coolant temperature sensor is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

Sensor Gasket SEF594K

<Reference data>

Engine coolant temperature °C (°F)	Voltage* V	Resistance $k\Omega$
-10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.1 - 2.9
50 (122)	2.2	0.68 - 1.00
90 (194)	0.9	0.236 - 0.260

*: These data are reference values and are measured between ECM terminal 73 (Engine coolant temperature sensor) and ground.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

On Board Diagnosis Logic

Removal and Installation ENGINE COOLANT TEMPERATURE SENSOR

Refer to CO-23, "THERMOSTAT AND THERMOSTAT HOUSING" .

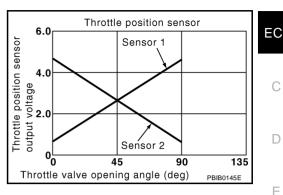

ABS000U3

DTC P0122, P0123 TP SENSOR

Component Description

Electric Throttle Control Actuator consists of throttle control motor, throttle position sensor, etc. The throttle position sensor responds to the throttle valve movement.

The throttle position sensor has the two sensors. These sensors are a kind of potentiometers which transform the throttle valve position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the throttle valve and feed the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION	
THRTL SEN1	Ignition switch: ON	Accelerator pedal: Fully released	More than 0.36V	
THRTL SEN2*	(Engine stopped) • Shift lever: D (A/T), 1st (M/T)	Accelerator pedal: Fully depressed	Less than 4.75V	G

*: Throttle position sensor 2 signal is converted by ECM internally. Thus, it differs from ECM terminal voltage signal.

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0122 0122	Throttle position sensor 2 circuit low input	An excessively low voltage from the TP sensor 2 is sent to ECM.	• Harness or connectors (TP sensor 2 circuit is open or shorted.)	
			(APP sensor 2 circuit is shorted.)Electric throttle control actuator	
P0123 0123	Throttle position sensor 2 circuit high input	An excessively high voltage from the TP sen- sor 2 is sent to ECM.	(TP sensor 2)	
0123		SUI 2 IS SEIT TO ECIVI.	 Accelerator pedal position sensor (APP sensor 2) 	

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operation condition in fail-safe mode

The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees.

The ECM regulates the opening speed of the throttle valve to be slower than the normal condition.

So, the acceleration will be poor.

DTC P0125 ECT SENSOR

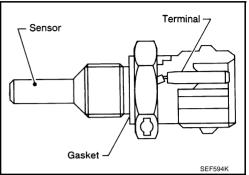

DTC P0125 ECT SENSOR

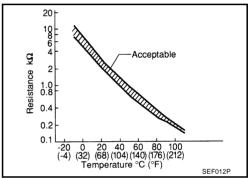

Component Description

NOTE:

If DTC P0125 is displayed with P0117 or P0118, first perform the trouble diagnosis for DTC P0117 or P0118. Refer to EC-178.

The engine coolant temperature sensor is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

<Reference data>

Engine coolant temperature °C (°F)	Voltage* V	Resistance kΩ
-10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.1 - 2.9
50 (122)	2.2	0.68 - 1.00
90 (194)	0.9	0.236 - 0.260

*: These data are reference values and are measured between ECM terminal 73 (Engine coolant temperature sensor) and ground.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

On Board Diagnosis Logic

This self-diagnosis has the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0125 0125	Insufficient engine cool- ant temperature for closed loop fuel control	 Voltage sent to ECM from the sensor is not practical, even when some time has passed after starting the engine. Engine coolant temperature is insufficient for closed loop fuel control. 	 Harness or connectors (High resistance in the circuit) Engine coolant temperature sensor Thermostat

Component Inspection ENGINE COOLANT TEMPERATURE SENSOR

1. Check resistance between engine coolant temperature sensor terminals 1 and 2 as shown in the figure.

<Reference data>

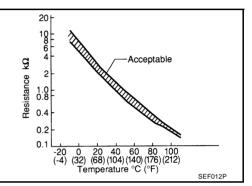

Engine coolant temperature °C (°F)	Voltage* V	Resistance $k\Omega$
-10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.1 - 2.9
50 (122)	2.2	0.68 - 1.00
90 (194)	0.9	0.236 - 0.260

*: These data are reference values and are measured between ECM terminal 73 (Engine coolant temperature sensor) and ground.

2. If NG, replace engine coolant temperature sensor.

Removal and Installation ENGINE COOLANT TEMPERATURE SENSOR

Refer to CO-23, "THERMOSTAT AND THERMOSTAT HOUSING" .

ABS000UJ

DTC P0127 IAT SENSOR

Component Description

The intake air temperature sensor is built into mass air flow sensor. The sensor detects intake air temperature and transmits a signal to the ECM.

The temperature sensing unit uses a thermistor which is sensitive to the change in temperature. Electrical resistance of the thermistor decreases in response to the temperature rise.

<Reference data>

Intake air temperature °C (°F)	Voltage* V	Resistance $k\Omega$
25 (77)	3.32	1.94 - 2.06
80 (176)	1.23	0.295 - 0.349

*: These data are reference values and are measured between ECM terminal 34 (Intake air temperature sensor) and ground.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

On Board Diagnosis Logic

	DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	J
-	P0127 0127	Intake air temperature too high	Rationally incorrect voltage from the sensor is sent to ECM, compared with the voltage signal from engine coolant temperature sensor.	 Harness or connectors (The sensor circuit is open or shorted) Intake air temperature sensor 	K

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

CAUTION:

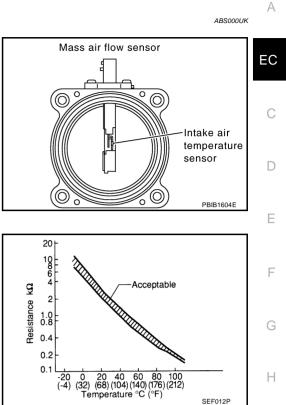

Always drive vehicle at a safe speed.

TESTING CONDITION:

This test may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

B WITH CONSULT-II

- 1. Wait until engine coolant temperature is less than 90°C (194°F)
- a. Turn ignition switch ON.

DTC P0128 THERMOSTAT FUNCTION

On Board Diagnosis Logic

Engine coolant temperature has not risen enough to open the thermostat even though the engine has run long enough.

This is due to a leak in the seal or the thermostat stuck open.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0128 0128	Thermostat function	The engine coolant temperature does not reach to specified temperature even though the engine has run long enough.	 Thermostat Leakage from sealing portion of thermostat Engine coolant temperature sensor

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

- For best results, perform at ambient temperature of -10°C (14°F) or higher.
- For best results, perform at engine coolant temperature of -10°C (14°F) to 60°C (140°F).

(I) WITH CONSULT-II

- 1. Replace thermostat with new one. Refer to <u>CO-23</u>, "<u>THERMOSTAT AND THERMOSTAT HOUSING</u>". Use only a genuine NISSAN thermostat as a replacement. If an incorrect thermostat is used, the MIL may come on.
- 2. Turn ignition switch ON.
- 3. Select "COOLAN TEMP/S" in "DATA MONITOR" mode with CONSULT-II.
- Check that the "COOLAN TEMP/S" is above 60°C (140°F). If it is below 60°C (140°F), go to following step. If it is above 60°C (140°F), cool down the engine to less than 60°C (140°F), then retry from step 1.
- 5. Drive vehicle for 10 consecutive minutes under the following conditions.

VHCL SPEED SE	80 - 120 km/h (50 - 75 MPH)

If 1st trip DTC is detected, go to EC-196, "Diagnostic Procedure"

DTC P0132, P0152 HO2S1

Component Description

The heated oxygen sensor 1 is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The heated oxygen sensor 1 has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The heated oxygen sensor 1 signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1 to 0V.

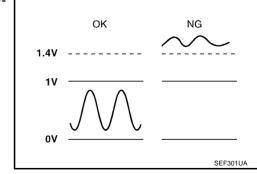

Specification data are reference values.

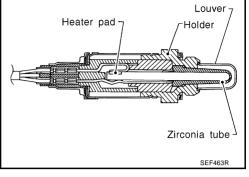

MONITOR ITEM	CONDITION		SPECIFICATION
HO2S1 (B1) HO2S1 (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$
HO2S1 MNTR (B1) HO2S1 MNTR (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	LEAN $\leftarrow \rightarrow$ RICH Changes more than 5 times during 10 seconds.

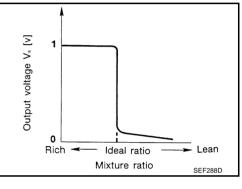

On Board Diagnosis Logic

To judge the malfunction, the diagnosis checks that the heated oxygen sensor 1 output is not inordinately high.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0132 0132 (Bank 1) P0152 0152 (Bank 2)	Heated oxygen sensor 1 circuit high voltage	An excessively high voltage from the sensor is sent to ECM.	 Harness or connectors (The sensor circuit is open or shorted) Heated oxygen sensor 1

DTC P0133, P0153 HO2S1

Component Description

The heated oxygen sensor 1 is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The heated oxygen sensor 1 has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The heated oxygen sensor 1 signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1 to 0V.

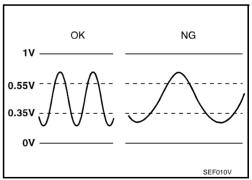

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

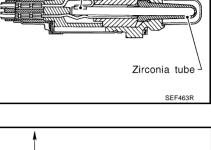

MONITOR ITEM	CONDITION		SPECIFICATION
HO2S1 (B1) HO2S1 (B2)	Engine: After warming up	Maintaining engine speed at 2,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$
HO2S1 MNTR (B1) HO2S1 MNTR (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	LEAN $\leftarrow \rightarrow$ RICH Changes more than 5 times during 10 seconds.

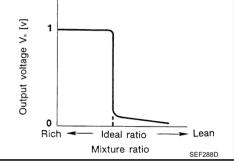

On Board Diagnosis Logic

To judge the malfunction of heated oxygen sensor 1, this diagnosis measures response time of heated oxygen sensor 1 signal. The time is compensated by engine operating (speed and load), fuel feedback control constant, and heated oxygen sensor 1 temperature index. Judgment is based on whether the compensated time (heated oxygen sensor 1 cycling time index) is inordinately long or not.

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

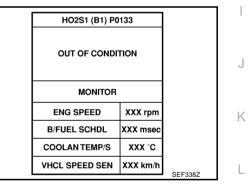

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 11V at idle.

WITH CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Stop engine and wait at least 10 seconds.
- 3. Turn ignition switch ON and select "HO2S1 (B1) P0133" or "HO2S1 (B2) P0153" of "HO2S1" in "DTC WORK SUPPORT" mode with CONSULT-II.
- 4. Touch "START".
- 5. Start engine and let it idle for at least 3 minutes. **NOTE:**

Never raise engine speed above 3,600 rpm after this step. If the engine speed limit is exceeded, return to step 5.

ABS000V7

Н

Μ

6. When the following conditions are met, "TESTING" will be displayed on the CONSULT-II screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 20 to 50 seconds.)

ENG SPEED	1,200 - 3,100 rpm
Vehicle speed	More than 80 km/h (50 MPH)
B/FUEL SCHDL	2.5 - 12.0 msec
Selector lever	Suitable position

If "TESTING" is not displayed after 5 minutes, retry from step 2.

 Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-214</u>, "<u>Diagnostic</u> <u>Procedure</u>".

Overall Function Check

ABS000V8

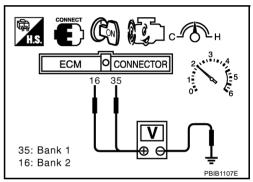

SEF658Y

Use this procedure to check the overall function of the heated oxygen sensor 1 circuit. During this check, a DTC might not be confirmed.

WITH GST

- 1. Start engine and warm it up to normal operating temperature.
- 2. Set voltmeter probes between ECM terminal 35 [HO2S1(B1) signal] or 16 [HO2S1(B2) signal] and engine ground.
- 3. Check the following with engine speed held at 2,000 rpm constant under no load.
- The voltage fluctuates between 0 to 0.3V and 0.6 to 1.0V more than 5 times within 10 seconds.

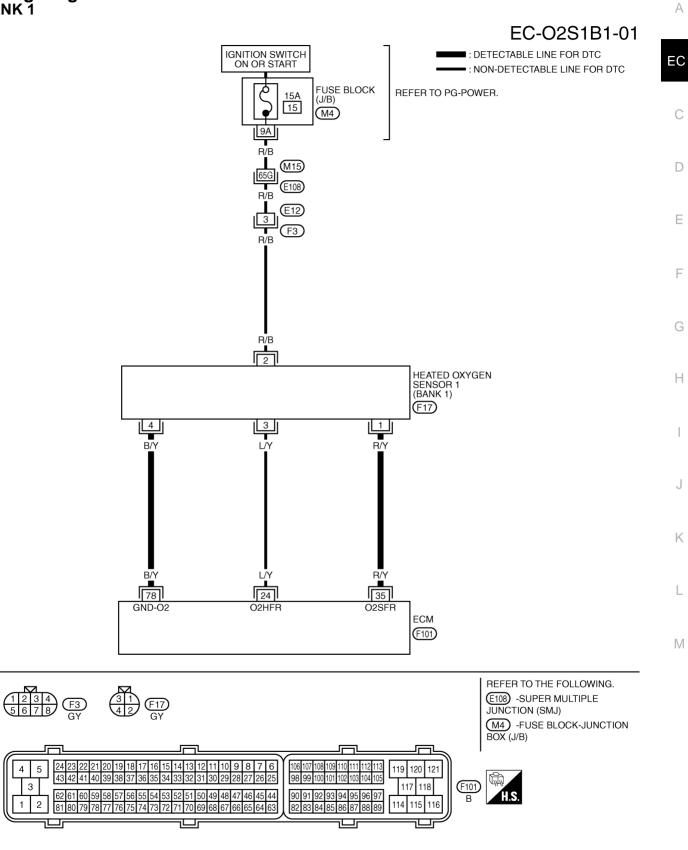

4. If NG, go to EC-214, "Diagnostic Procedure" .

Removal and Installation HEATED OXYGEN SENSOR 1

Refer to EM-23, "EXHAUST MANIFOLD AND THREE WAY CATALYST" .

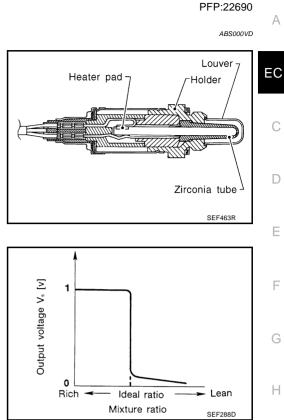

ABS000VC

DTC P0134, P0154 HO2S1

Component Description

The heated oxygen sensor 1 is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The heated oxygen sensor 1 has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The heated oxygen sensor 1 signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1 to 0V.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

			1	
MONITOR ITEM	CONDITION		SPECIFICATION	J
HO2S1 (B1) HO2S1 (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$	
HO2S1 MNTR (B1) HO2S1 MNTR (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	LEAN $\leftarrow \rightarrow$ RICH Changes more than 5 times during 10 seconds.	Κ

On Board Diagnosis Logic

Under the condition in which the heated oxygen sensor 1 signal is not input, the ECM circuits will read a continuous approximately 0.3V. Therefore, for this diagnosis, the time that output voltage is within 200 to 400 mV range is monitored, and the diagnosis checks that this time is not inordinately long.

ABS000VL

DTC P0138, P0158 HO2S2

DTC P0138, P0158 HO2S2

Component Description

The heated oxygen sensor 2, after three way catalyst 1, monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the heated oxygen sensor 1 are shifted, the air-fuel ratio is controlled to stoichiometric, by the signal from the heated oxygen sensor 2.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the heated oxygen sensor 2 is not used for engine control operation.

CONSULT-II Reference Value in Data Monitor Mode

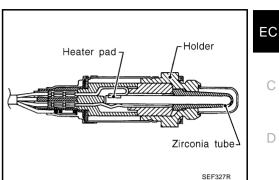

Specification data are reference values.

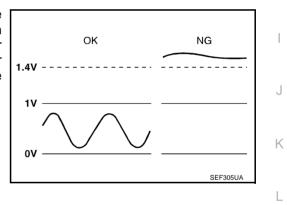

MONITOR ITEM	CON	IDITION	SPECIFICATION	F
HO2S2 (B1) HO2S2 (B2)	Warm-up conditionAfter keeping engine speed	Revving engine from idle to 3,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$	
HO2S2 MNTR (B1) HO2S2 MNTR (B2)	between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load.	quickly.	$LEAN \leftarrow \rightarrow RICH$	G

On Board Diagnosis Logic

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the heated oxygen sensor 1. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the voltage is unusually high during the various driving condition such as fuel-cut.

DTC P0139, P0159 HO2S2

Component Description

The heated oxygen sensor 2, after three way catalyst 1, monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the heated oxygen sensor 1 are shifted, the air-fuel ratio is controlled to stoichiometric, by the signal from the heated oxygen sensor 2.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the heated oxygen sensor 2 is not used for engine control operation.

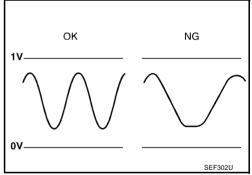

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

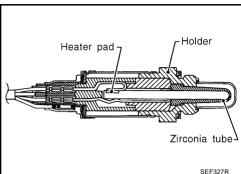

MONITOR ITEM	CON	IDITION	SPECIFICATION
HO2S2 (B1) HO2S2 (B2)	Warm-up conditionAfter keeping engine speed	Revving engine from idle to 3,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$
HO2S2 MNTR (B1) HO2S2 MNTR (B2)	between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load.	quickly.	$LEAN \longleftrightarrow RICH$

On Board Diagnosis Logic

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the heated oxygen sensor 1. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the switching response of the sensor's voltage is faster than specified during the various driving condition such as fuel-cut.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0139 0139 (Bank 1)	- Heated oxygen sensor	It takes more time for the sensor to respond	 Harness or connectors (The sensor circuit is open or shorted) Heated oxygen sensor 2
P0159 0159 (Bank 2)	2 circuit slow response	between rich and lean than the specified time.	 Fuel pressure Injectors Intake air leaks

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

B WITH CONSULT-II

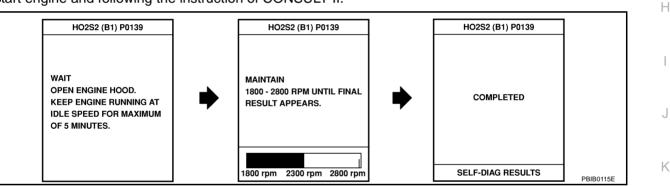

TESTING CONDITION:

For better results, perform "DTC WORK SUPPORT" at a temperature of 0 to 30 °C (32 to 86 °F).

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 2. Start engine and warm it up to the normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 5. Let engine idle for 1 minute.
- Make sure that "COOLAN TEMP/S" indicates more than 70°C (158°F).
 If not, warm up engine and go to next step when "COOLAN

TEMP/S" indication reaches to 70°C (158°F).

- 7. Select "HO2S2 (B1) P0139" or "HO2S2 (B2) P0159" of "HO2S2" in "DTC WORK SUPPORT" mode with CONSULT-II.
- 8. Start engine and following the instruction of CONSULT-II.

 Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-246, "Diagnostic Procedure"</u>. If "CAN NOT BE DIAGNOSED" is displayed, perform the following.

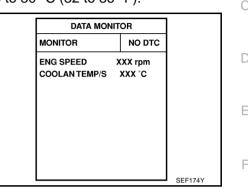

- a. Turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle).
- b. Return to step 1.

Overall Function Check

Use this procedure to check the overall function of the heated oxygen sensor 2 circuit. During this check, a DTC might not be confirmed.

WITH GST

- 1. Start engine and warm it up to the normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 4. Let engine idle for 1 minute.
- 5. Set voltmeter probes between ECM terminal 74 [HO2S2 (B1) signal] or 55 [HO2S2 (B2) signal] and engine ground.

2. CLEAR THE SELF-LEARNING DATA

With CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Select "SELF-LEARNING CONT" in "WORK SUPPORT" mode with CONSULT-II.
- 3. Clear the self-learning control coefficient by touching "CLEAR".
- Run engine for at least 10 minutes at idle speed. Is the 1st trip DTC P0171, P0172, P0174 or P0175 detected? Is it difficult to start engine?

Without CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF.
- 3. Disconnect mass air flow sensor harness connector, and restart and run engine for at least 5 seconds at idle speed.
- 4. Stop engine and reconnect mass air flow sensor harness connector.
- 5. Make sure DTC P0102 is displayed.
- 6. Erase the DTC memory. Refer to <u>EC-60, "HOW TO ERASE</u> <u>EMISSION-RELATED DIAGNOSTIC INFORMATION"</u>.
- 7. Make sure DTC P0000 is displayed.
- Run engine for at least 10 minutes at idle speed.
 Is the 1st trip DTC P0171, P0172, P0174 or P0175 detected?
 Is it difficult to start engine?

Yes or No

Yes \Rightarrow Perform trouble diagnosis for DTC P0171, P0174 or P0172, P0175. Refer to <u>EC-251</u> or <u>EC-259</u>. No \Rightarrow GO TO 3.

3. CHECK HO2S2 GROUND CIRCUIT FOR OPEN AND SHORT

- 1. Turn ignition switch OFF.
- 2. Disconnect ECM harness connector.
- 3. Disconnect heated oxygen sensor 2 harness connector.
- 4. Check harness continuity between HO2S2 terminal 4 and ECM terminal 78.

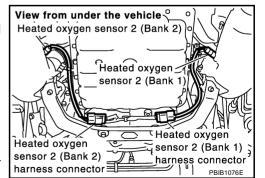

Refer to Wiring Diagram.

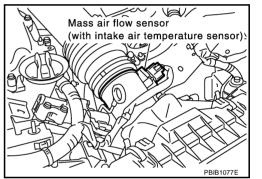

Continuity should exist.

- 1. Remove injector assembly. Refer to <u>EM-34</u>, "<u>FUEL INJECTOR AND FUEL TUBE</u>". Keep fuel hose and all injectors connected to injector gallery.
- 2. Confirm that the engine is cooled down and there are no fire hazards near the vehicle.
- 3. Disconnect all injector harness connectors.
- 4. Disconnect all ignition coil harness connectors.
- 5. Prepare pans or saucers under each injectors.
- Crank engine for about 3 seconds. Make sure fuel does not drip from injector.

OK or NG

OK (Does not drip.)>>GO TO 9.

NG (Drips.)>>Replace the injectors from which fuel is dripping. Always replace O-ring with new one.

9. CHECK INTERMITTENT INCIDENT

Refer to EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT" .

>> INSPECTION END

Component Description

The fuel tank temperature sensor is used to detect the fuel temperature inside the fuel tank. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the fuel temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

<Reference data>

Fluid temperature °C (°F)	Voltage* V	Resistance kΩ
20 (68)	3.5	2.3 - 2.7
50 (122)	2.2	0.79 - 0.90

*: These data are reference values and are measured between ECM terminal 107 (Fuel tank temperature sensor) and ground.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

On Board Diagnosis Logic

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0181 0181	Fuel tank temperature sensor circuit range/ performance	Rationally incorrect voltage from the sensor is sent to ECM, compared with the voltage sig- nals from engine coolant temperature sensor and intake air temperature sensor.	 Harness or connectors (The sensor circuit is open or shorted) Fuel tank temperature sensor 	

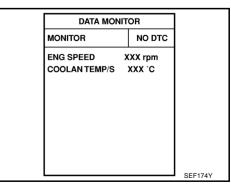

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

WITH CONSULT-II

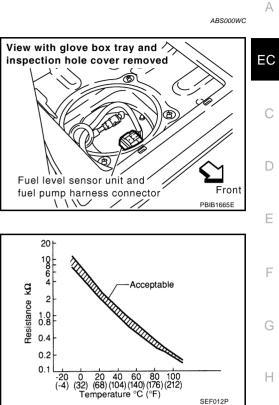

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- Wait at least 10 seconds. 3. If the result is NG, go to EC-270, "Diagnostic Procedure" . If the result is OK, go to following step.
- Check "COOLAN TEMP/S" value. 4. If "COOLAN TEMP/S" is less than 60°C (140°F), the result will be OK. If "COOLAN TEMP/S" is above 60°C (140°F), go to the following step.
- Cool engine down until "COOLAN TEMP/S" is less than 60°C 5. (140°F).
- Wait at least 10 seconds. 6.
- 7. If 1st trip DTC is detected, go to EC-270, "Diagnostic Procedure" .

Removal and Installation FUEL TANK TEMPERATURE SENSOR

Refer to FL-5, "FUEL LEVEL SENSOR UNIT, FUEL FILTER AND FUEL PUMP ASSEMBLY" .

DTC P0222, P0223 TP SENSOR

Component Description

Electric Throttle Control Actuator consists of throttle control motor, throttle position sensor, etc. The throttle position sensor responds to the throttle valve movement.

The throttle position sensor has the two sensors. These sensors are a kind of potentiometers which transform the throttle valve position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the throttle valve and feed the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM CON		IDITION	SPECIFICATION
THRTL SEN1	Ignition switch: ON	Accelerator pedal: Fully released	More than 0.36V
THRTL SEN2*	(Engine stopped) • Shift lever: D (A/T), 1st (M/T)	Accelerator pedal: Fully depressed	Less than 4.75V

*: Throttle position sensor 2 signal is converted by ECM internally. Thus, it differs from ECM terminal voltage signal.

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic.

DTC No. DTC detecting condition Possible cause Trouble diagnosis name P0222 Throttle position sensor An excessively low voltage from the TP sensor • Harness or connectors 0222 1 is sent to ECM. 1 circuit low input (TP sensor 1 circuit is open or shorted.) (APP sensor 2 circuit is shorted.) Electric throttle control actuator P0223 Throttle position sensor An excessively high voltage from the TP sen-(TP sensor 1) 0223 1 circuit high input sor 1 is sent to ECM. • Accelerator pedal position sensor (APP sensor 2)

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode an the MIL lights up.

Engine operation condition in fail-safe mode

The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 dearees.

The ECM regulates the opening speed of the throttle valve to be slower than the normal condition.

So, the acceleration will be poor.

ABS000X5

ABS00DBB

DTC P0300 - P0306 MULTIPLE CYLINDER MISFIRE, NO. 1 - 6 CYLINDER MIS-FIRE

On Board Diagnosis Logic

When a misfire occurs, engine speed will fluctuate. If the engine speed fluctuates enough to cause the crank-shaft position (CKP) sensor (POS) signal to vary, ECM can determine that a misfire is occurring.

Sensor	Input Signal to ECM	ECM function	
Crankshaft position sensor (POS)	Engine speed	On board diagnosis of misfire	С

The misfire detection logic consists of the following two conditions.

1. One Trip Detection Logic (Three Way Catalyst Damage)

On the first trip that a misfire condition occurs that can damage the three way catalyst (TWC) due to overheating, the MIL will blink.

When a misfire condition occurs, the ECM monitors the CKP sensor signal every 200 engine revolutions for a change.

When the misfire condition decreases to a level that will not damage the TWC, the MIL will turn off. If another misfire condition occurs that can damage the TWC on a second trip, the MIL will blink. When the misfire condition decreases to a level that will not damage the TWC, the MIL will remain on. If another misfire condition occurs that can damage the TWC, the MIL will begin to blink again.

2. Two Trip Detection Logic (Exhaust quality deterioration)

For misfire conditions that will not damage the TWC (but will affect vehicle emissions), the MIL will only light when the misfire is detected on a second trip. During this condition, the ECM monitors the CKP sensor signal every 1,000 engine revolutions.

A misfire malfunction can be detected on any one cylinder or on multiple cylinders.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0300 0300	Multiple cylinder misfire detected	Multiple cylinder misfire.	Improper spark plug
P0301 0301	No.1 cylinder misfire detected	No. 1 cylinder misfires.	 Insufficient compression Incorrect fuel pressure
P0302 0302	No. 2 cylinder misfire detected	No. 2 cylinder misfires.	The injector circuit is open or shortedFuel injectors

Н

А

ABSOOOXM

ABS000XN

B WITH CONSULT-II

- 1. Turn ignition switch ON, and select "DATA MONITOR" mode with CONSULT-II.
- 2. Start engine and warm it up to normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Restart engine and let it idle for about 15 minutes.
- 5. If 1st trip DTC is detected, go to EC-284, "Diagnostic Procedure"

NOTE:

If 1st trip DTC is not detected during above procedure, performing the following procedure is advised.

- 1. Turn ignition switch OFF and wait at least 10 seconds.
- 2. Start engine and drive the vehicle under the similar conditions to (1st trip) Freeze Frame Data for a certain time. Refer to the table below.

Hold the accelerator pedal as steady as possible.

The similar conditions to (1st trip) Freeze Frame Data means the vehicle operation that the following conditions should be satisfied at the same time.

Engine speed	Engine speed in the freeze frame data \pm 400 rpm	
Vehicle speed	Vehicle speed in the freeze frame data \pm 10 km/h (6 MPH)	
Engine coolant temperature	When the freeze frame data shows lower than 70 °C (158 °F), T should be lower than 70 °C (158 °F).	
(T) condition	When the freeze frame data shows higher than or equal to 70 °C (158 °F), T should be higher than or equal to 70 °C (158 °F).	

The time to driving varies according to the engine speed in the freeze frame data.

Engine speed	Time
Around 1,000 rpm	Approximately 10 minutes
Around 2,000 rpm	Approximately 5 minutes
More than 3,000 rpm	Approximately 3.5 minutes

WITH GST

Follow the procedure "WITH CONSULT-II" above.

Diagnostic Procedure

1. CHECK FOR INTAKE AIR LEAK AND PCV HOSE

- 1. Start engine and run it at idle speed.
- 2. Listen for the sound of the intake air leak.
- 3. Check PCV hose connection.

OK or NG

OK >> GO TO 2.

NG >> Discover air leak location and repair.

DTC P0327, P0328 KS

Component Description

The knock sensor is attached to the cylinder block. It senses engine knocking using a piezoelectric element. A knocking vibration from the cylinder block is sensed as vibrational pressure. This pressure is converted into a voltage signal and sent to the ECM.

On Board Diagnosis Logic

The MIL will not light up for these diagnoses.

DTC No.	Trouble diagnosis name	DTC detected condition	Possible cause	F
P0327 0327	Knock sensor circuit low input	An excessively low voltage from the sensor is sent to ECM.	 Harness or connectors (The sensor circuit is open or shorted.) 	G
P0328 0328	Knock sensor circuit high input	An excessively high voltage from the sensor is sent to ECM.	Knock sensor	

DTC Confirmation Procedure

NOTE:

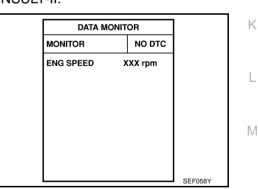

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 10V at idle.

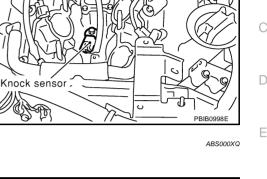

(I) WITH CONSULT-II

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 2. Start engine and run it for at least 5 seconds at idle speed.
- 3. If 1st trip DTC is detected, go to EC-291, "Diagnostic Procedure"

Component Description

The crankshaft position sensor (POS) is located on the oil pan facing the gear teeth (cogs) of the signal plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet and Hall IC.

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION

Component Description

The camshaft position sensor (PHASE) senses the retraction of intake valve camshaft to identify a particular cylinder. The camshaft position sensor (PHASE) senses the piston position.

When the crankshaft position sensor (POS) system becomes inoperative, the camshaft position sensor (PHASE) provides various controls of engine parts instead, utilizing timing of cylinder identification signals.

The sensor consists of a permanent magnet and Hall IC.

When engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

CONSULT-II Reference Value in Data Monitor Mode

DTC P0420, P0430 THREE WAY CATALYST FUNCTION

On Board Diagnosis Logic

PFP:20905

ABS000YB

The ECM monitors the switching frequency ratio of heated oxygen sensors 1 and 2.

A three way catalyst 1 with high oxygen storage capacity will indicate a low switching frequency of heated oxygen sensor 2. As oxygen storage capacity decreases, the heated oxygen sensor 2 switching frequency will increase.

When the frequency ratio of heated oxygen sensors 1 and 2 approaches a specified limit value, the three way catalyst 1 malfunction is diagnosed.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0420	20 ank 1)	Three way catalyst 1 does not operate prop-	 Three way catalyst 1
0420 (Bank 1)			 Exhaust tube
			 Intake air leaks
D 0400	Catalyst system effi- ciency below threshold	erly.	 Fuel injectors
P0430 0430 (Bank 2)		• Three way catalyst 1 does not have enough oxygen storage capacity.	 Fuel injector leaks
			 Spark plug
			 Improper ignition timing

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

WITH CONSULT-II

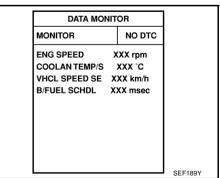

TESTING CONDITION:

Do not hold engine speed for more than the specified minutes below.

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 2. Start engine and warm it up to the normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 5. Let engine idle for 1 minute.
- Make sure that "COOLAN TEMP/S" indicates more than 70°C (158°F).
 If not, warm up engine and go to next step when "COOLAN

TEMP/S" indication reaches to 70°C (158°F).

7. Open engine hood.

ARSODOVC

DTC P0420, P0430 THREE WAY CATALYST FUNCTION

Revision: 2004 November

- Select "DTC & SRT CONFIRMATION" then "SRT WORK SUP-PORT" mode with CONSULT-II.
- Rev engine up to 2,000 to 3,000 rpm and hold it for 3 consecu-9. tive minutes then release the accelerator pedal completely. If "INCMP" of "CATALYST" changed to "CMPLT", go to step 12.

11. Rev engine up to 2,000 to 3,000 rpm and maintain it until "INCMP" of "CATALYST" changes to "CMPLT" (It will take

If not "CMPLT", stop engine and cool it down to less than 70°C

Overall Function Check

Use this procedure to check the overall function of the three way catalyst 1. During this check, a DTC might not be confirmed.

WITH GST

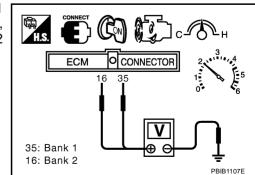

dure".

1. Turn ignition switch OFF and wait at least 10 seconds.

12. Select "SELF-DIAG RESULTS" mode with CONSULT-II.

13. Confirm that the 1st trip DTC is not detected.

- Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load. 2.
- 3. Let engine idle for 1 minute.
- 4. Open engine hood.
- Set voltmeters probes between ECM terminals 35 [HO2S1 5. (bank 1) signal], 16 [HO2S1 (bank 2) signal] and engine ground, and ECM terminals 74 [HO2S2 (bank 1) signal], 55 [HO2S2 (bank 2) signal] and engine ground.
- 6. Keep engine speed at 2,000 rpm constant under no load.

EC-309

Μ

SEF535Z

ABS000YD

DTC P0420, P0430 THREE WAY CATALYST FUNCTION

7. Make sure that the voltage switching frequency (high & low) between ECM terminals 74 and engine ground, or 55 and engine ground is very less than that of ECM terminals 35 and engine ground, or 16 and engine ground.
Switching frequency ratio = A/B
A: Heated oxygen sensor 2 voltage switching frequency
B: Heated oxygen sensor 1 voltage switching frequency
This ratio should be less than 0.75. If the ratio is greater than above, it means three way catalyst 1 does not operate properly. Go to EC-310, "Diagnostic Procedure".

If the voltage at terminal 35 or 16 does not switch periodically more than 5 times within 10 seconds at step 7, perform trouble diagnosis for DTC P0133, P0153 first. (See EC-208.)

Diagnostic Procedure

1. CHECK EXHAUST SYSTEM

Visually check exhaust tubes and muffler for dent.

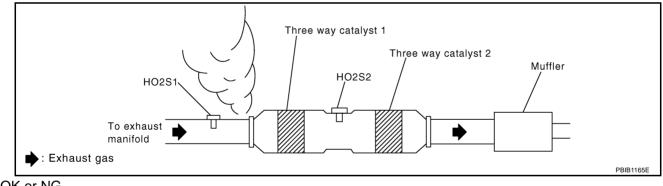

OK or NG

OK >> GO TO 2.

NG >> Repair or replace.

2. CHECK EXHAUST GAS LEAK

- 1. Start engine and run it at idle.
- 2. Listen for an exhaust gas leak before the three way catalyst 1.

OK or NG

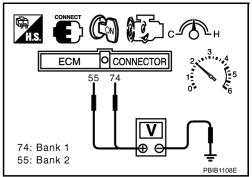

OK >> GO TO 3. NG >> Repair or replace.

3. CHECK INTAKE AIR LEAK

Listen for an intake air leak after the mass air flow sensor.

OK or NG

- OK >> GO TO 4.
- NG >> Repair or replace.

ABS000YE

4. CHECK IGNITION TIMING

Check the following iter	ms. Refer	to EC-77, "Basic Inspection" .
Items		Specifications
Target idle speed	A/T	650 ± 50 rpm (in P or N position)
Target fulle speed	M/T	650 ± 50 rpm (in N position)
Ignition timing	A/T	$15\pm5^\circ$ BTDC (in P or N position)
	M/T	$15\pm5^\circ$ BTDC (in N position)

OK or NG

OK >> GO TO 5.

NG >> Follow the <u>EC-77</u>, "Basic Inspection".

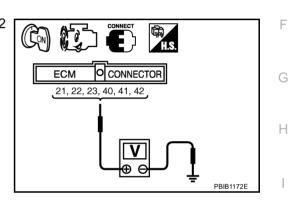

5. CHECK INJECTORS

- 1. Stop engine and then turn ignition switch ON.
- Check voltage between ECM terminals 21, 22, 23, 40, 41, 42 and ground with CONSULT-II or tester. Refer to Wiring Diagram for Injectors, <u>EC-585</u>.

Battery voltage should exist.

OK or NG

- OK >> GO TO 6.
- NG >> Perform <u>EC-586, "Diagnostic Procedure"</u>.

D

F

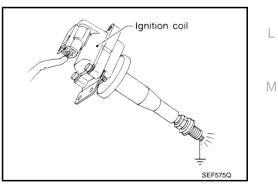

Κ

6. CHECK IGNITION SPARK

- 1. Turn ignition switch OFF.
- 2. Disconnect ignition coil assembly from rocker cover.
- 3. Connect a known good spark plug to the ignition coil assembly.
- 4. Place end of spark plug against a suitable ground and crank engine.
- 5. Check for spark.

OK or NG

- OK >> GO TO 7.
- NG >> Check ignition coil with power transistor and their circuit. Refer to <u>EC-572, "IGNITION SIGNAL"</u>.

7. CHECK INJECTOR

- 1. Turn ignition switch OFF.
- Remove injector assembly. Refer to <u>EM-34, "FUEL INJECTOR AND FUEL TUBE"</u>. Keep fuel hose and all injectors connected to injector gallery.
- 3. Disconnect all ignition coil harness connectors.
- 4. Turn ignition switch ON. Make sure fuel does not drip from injector.

OK or NG

OK (Does not drip.)>>GO TO 8.

NG (Drips.)>>Replace the injector(s) from which fuel is dripping.

8. CHECK INTERMITTENT INCIDENT

Refer to EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT" .

Trouble is fixed.>>INSPECTION END

Trouble is not fixed.>>Replace three way catalyst assembly.

DTC P0441 EVAP CONTROL SYSTEM

DTC P0441 EVAP CONTROL SYSTEM

System Description

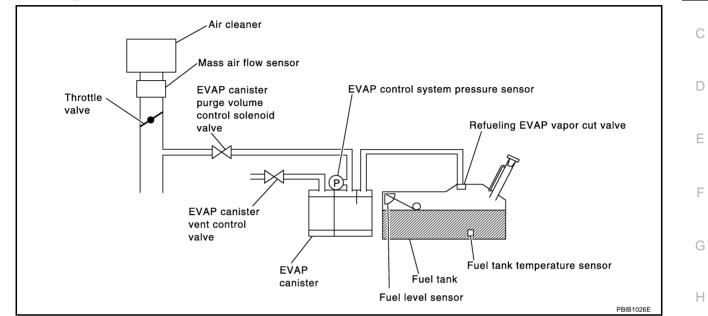

PFP:14950

А

EC

NOTE:

If DTC P0441 is displayed with other DTC such as P2122, P2123, P2127, P2128 or P2138, first perform trouble diagnosis for other DTC.

In this evaporative emission (EVAP) control system, purge flow occurs during non-closed throttle conditions. Purge volume is related to air intake volume. Under normal purge conditions (non-closed throttle), the EVAP canister purge volume control solenoid valve is open to admit purge flow. Purge flow exposes the EVAP control system pressure sensor to intake manifold vacuum.

On Board Diagnosis Logic

ABS000YG

Under normal conditions (non-closed throttle), sensor output voltage indicates if pressure drop and purge flow are adequate. If not, a malfunction is determined.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0441 0441	EVAP control system incorrect purge flow	EVAP control system does not operate prop- erly, EVAP control system has a leak between intake manifold and EVAP control system pres- sure sensor.	 EVAP canister purge volume control solenoid valve stuck closed
			 EVAP control system pressure sensor and the circuit
			 Loose, disconnected or improper con- nection of rubber tube
			 Blocked rubber tube
			 Cracked EVAP canister
			 EVAP canister purge volume control solenoid valve circuit
			 Accelerator pedal position sensor
			 Blocked purge port
			 EVAP canister vent control valve

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

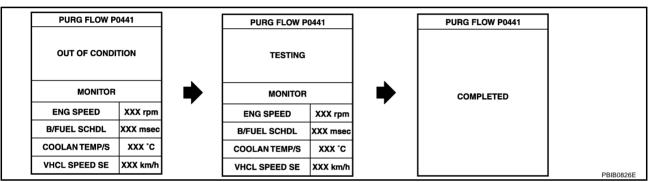

Always perform test at a temperature of 5°C (41°F) or more.

ABS000YH

WITH CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Start engine and let it idle for at least 70 seconds.
- 4. Select "PURG FLOW P0441" of "EVAPORATIVE SYSTEM" in "DTC CONFIRMATION" mode with CON-SULT-II.
- 5. Touch "START".
 - If "COMPLETED" is displayed, go to step 7.
- 6. When the following conditions are met, "TESTING" will be displayed on the CONSULT-II screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take at least 35 seconds.)

Selector lever	Suitable position
Vehicle speed	32 - 120 km/h (20 - 75 MPH)
ENG SPEED	500 - 3,000 rpm
B/FUEL SCHDL	1.3 - 9.0 msec
Engine coolant temperature	70 - 100°C (158 - 212°F)

If "TESTING" is not changed for a long time, retry from step 2.

7. Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-</u> <u>315, "Diagnostic Procedure"</u>.

Overall Function Check

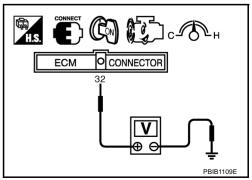

ABS000Y

Use this procedure to check the overall monitoring function of the EVAP control system purge flow monitoring. During this check, a DTC might not be confirmed.

WITH GST

- 1. Lift up drive wheels.
- 2. Start engine (TCS switch OFF) and warm it up to normal operating temperature.
- 3. Turn ignition switch OFF, wait at least 10 seconds.
- 4. Start engine and wait at least 70 seconds.
- 5. Set voltmeter probes to ECM terminals 32 (EVAP control system pressure sensor signal) and ground.
- 6. Check EVAP control system pressure sensor value at idle speed and note it.
- 7. Establish and maintain the following conditions for at least 1 minute.

Air conditioner switch	ON
Headlamp switch	ON
Rear window defogger switch	ON
Engine speed	Approx. 3,000 rpm
Gear position	Any position other than P, N or R

8. Verify that EVAP control system pressure sensor value stays 0.1V less than the value at idle speed (measured at step 6) for at least 1 second.

Refer to EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT" .

>> INSPECTION END

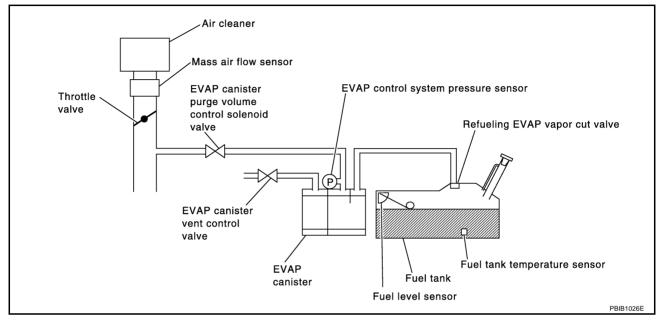

DTC P0442 EVAP CONTROL SYSTEM

On Board Diagnosis Logic

This diagnosis detects leaks in the EVAP purge line using engine intake manifold vacuum.

If pressure does not increase, the ECM will check for leaks in the line between the fuel tank and EVAP canister purge volume control solenoid valve, under the following Vacuum test conditions.

The EVAP canister vent control valve is closed to shut the EVAP purge line off. The EVAP canister purge volume control solenoid valve will then be opened to depressurize the EVAP purge line using intake manifold vacuum. After this occurs, the EVAP canister purge volume control solenoid valve will be closed.

PFP:14950

DTC P0442 EVAP CONTROL SYSTEM

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
			 Incorrect fuel tank vacuum relief valve 	
			 Incorrect fuel filler cap used 	
			 Fuel filler cap remains open or fails to close. 	
			 Foreign matter caught in fuel filler cap. 	
			 Leak is in line between intake manifold and EVAP canister purge volume control solenoid valve. 	
			 Foreign matter caught in EVAP canister vent control valve. 	
			 EVAP canister or fuel tank leaks 	
			 EVAP purge line (pipe and rubber tube) leaks 	
		EVAP control system has a leak, EVAP control system does not operate properly.	 EVAP purge line rubber tube bent 	
P0442 0442	EVAP control system small leak detected (negative pressure)		 Blocked or bent rubber tube to EVAP control system pressure sensor 	
			 Loose or disconnected rubber tube 	
			• EVAP canister vent control valve and the circuit	
			 EVAP canister purge volume control solenoid valve and the circuit 	
			 Fuel tank temperature sensor 	
			 O-ring of EVAP canister vent control valve is missing or damaged 	
			 EVAP canister is saturated with water 	
			 EVAP control system pressure sensor 	
			 Fuel level sensor and the circuit 	
			 Refueling EVAP vapor cut valve 	

NOTE:

 If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

- Perform "DTC WORK SUPPORT" when the fuel level is between 1/4 and 3/4 full, and vehicle is placed on flat level surface.
- Always perform test at a temperature of 0 to 30°C (32 to 86°F).

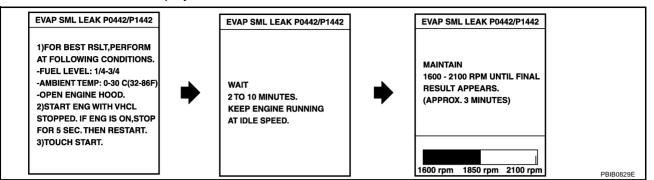

B WITH CONSULT-II

- 1. Turn ignition switch ON.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- Make sure that the following conditions are met. COOLAN TEMP/S: 0 - 70°C (32 - 158°F) INT/A TEMP SE: 0 - 30°C (32 - 86°F)
- 5. Select "EVAP SML LEAK P0442/P1442" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT-II.

EC-319

Μ

Follow the instruction displayed.

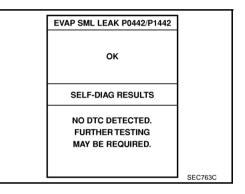

NOTE:

If the engine speed cannot be maintained within the range displayed on the CONSULT-II screen, go to <u>EC-77, "Basic Inspection"</u>.

6. Make sure that "OK" is displayed.

If "NG" is displayed, refer to <u>EC-321, "Diagnostic Procedure"</u>. **NOTE:**

Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valve properly.

WITH GST

NOTE:

Be sure to read the explanation of Driving Pattern on EC-57 before driving vehicle.

- 1. Start engine.
- 2. Drive vehicle according to EC-57, "Driving Pattern" .
- 3. Stop vehicle.
- 4. Select "MODE 1" with GST.
- If SRT of EVAP system is not set yet, go to the following step.
- If SRT of EVAP system is set, the result will be OK.
- 5. Turn ignition switch OFF and wait at least 10 seconds.
- 6. Start engine.

It is not necessary to cool engine down before driving.

- 7. Drive vehicle again according to the EC-57, "Driving Pattern" .
- 8. Stop vehicle.
- 9. Select "MODE 3" with GST.
- If P0442 is displayed on the screen, go to <u>EC-321, "Diagnostic Procedure"</u>.
- If P0441 is displayed on the screen, go to Diagnostic Procedure for DTC P0441, EC-315.
- If P0441 and P0442 are not displayed on the screen, go to the following step.
- 10. Select "MODE 1" with GST.
- If SRT of EVAP system is set, the result will be OK.
- If SRT of EVAP system is not set, go to step 6.

DTC P0442 EVAP CONTROL SYSTEM

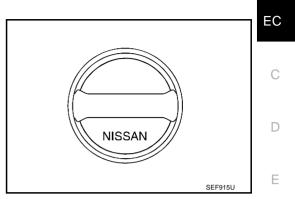

Diagnostic Procedure

1. CHECK FUEL FILLER CAP DESIGN

- 1. Turn ignition switch OFF.
- 2. Check for genuine NISSAN fuel filler cap design.

OK or NG

- OK >> GO TO 2.
- NG >> Replace with genuine NISSAN fuel filler cap.

2. CHECK FUEL FILLER CAP INSTALLATION

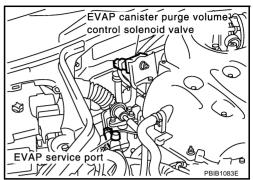

Check that the cap is tightened properly by rotating the cap clockwise.	F
OK or NG	
 OK >> GO TO 3. NG >> 1. Open fuel filler cap, then clean cap and fuel filler neck threads using air blower. 2. Retighten until ratcheting sound is heard. 	G
3. CHECK FUEL FILLER CAP FUNCTION	Н
Check for air releasing sound while opening the fuel filler cap.	
OK or NG	I
OK >> GO TO 5. NG >> GO TO 4.	
4. CHECK FUEL TANK VACUUM RELIEF VALVE	J
Refer to <u>EC-627, "FUEL TANK VACUUM RELIEF VALVE (BUILT INTO FUEL FULLER CAP)"</u> . <u>OK or NG</u>	K
OK >> GO TO 5.	
NG >> Replace fuel filler cap with a genuine one.	L
	D. A
	M

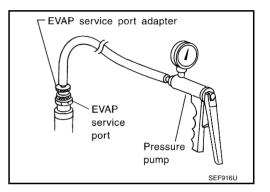

ABS000YM

А

5. INSTALL THE PRESSURE PUMP

To locate the EVAP leak, install EVAP service port adapter and pressure pump to EVAP service port securely. For the location of EVAP service port, refer to <u>EC-625</u>, "<u>EVAPORATIVE EMISSION LINE</u> <u>DRAWING</u>".

NOTE:

Improper installation of the EVAP service port adapter to the EVAP service port may cause leaking.

Models with CONSULT-II>>GO TO 6. Models without CONSULT-II>>GO TO 7.

DTC P0442 EVAP CONTROL SYSTEM

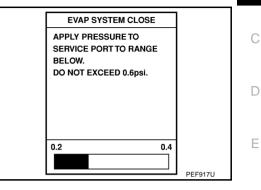

6. CHECK FOR EVAP LEAK

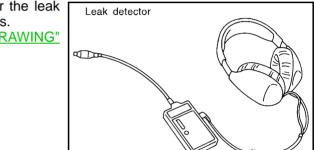

(P) With CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "EVAP SYSTEM CLOSE" of "WORK SUPPORT" mode with CONSULT-II.
- 3. Touch "START" and apply pressure into the EVAP line until the pressure indicator reaches the middle of the bar graph.

NOTE:

- Never use compressed air or a high pressure pump.
- Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in the system.

 Using EVAP leak detector, locate the EVAP leak. For the leak detector, refer to the instruction manual for more details. Refer to <u>EC-625</u>, "EVAPORATIVE EMISSION LINE DRAWING"

OK or NG

- OK >> GO TO 8.
- NG >> Repair or replace.

7. CHECK FOR EVAP LEAK

Without CONSULT-II

- 1. Turn ignition switch OFF.
- 2. Apply 12 volts DC to EVAP canister vent control valve. The valve will close. (Continue to apply 12 volts until the end of test.)

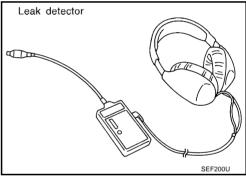

3. Pressurize the EVAP line using pressure pump with 1.3 to 2.7 kPa (10 to 20 mmHg, 0.39 to 0.79 inHg), then remove pump and EVAP service port adapter.

NOTE:

- Never use compressed air or a high pressure pump.
- Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in the system.
- Using EVAP leak detector, locate the EVAP leak. For the leak detector, refer to the instruction manual for more details. Refer to <u>EC-625</u>, "<u>EVAPORATIVE EMISSION LINE DRAWING</u>".

OK or NG

- OK >> GO TO 8.
- NG >> Repair or replace.

8. CHECK EVAP CANISTER VENT CONTROL VALVE

Check the following.

- EVAP canister vent control valve is installed properly. Refer to <u>EC-628, "Removal and Installation"</u>.
- EVAP canister vent control valve. Refer to <u>EC-340</u>, "Component Inspection".

OK or NG

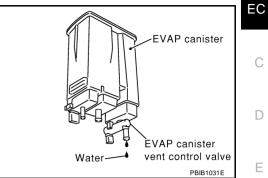

- OK >> GO TO 9.
- NG >> Repair or replace EVAP canister vent control valve and O-ring.

DTC P0442 EVAP CONTROL SYSTEM

9. CHECK IF EVAP CANISTER SATURATED WITH WATER

- 1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
- 2. Does water drain from the EVAP canister?
- Yes or No

Yes >> GO TO 10. No (With CONSULT-II)>>GO TO 12. No (Without CONSULT-II)>>GO TO 13.

А

L

Fuel tank temperature sensor	Fuel temperature in fuel tank			
Wheel sensor* ²	Vehicle speed			

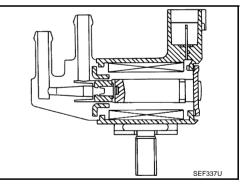

*1:ECM determines the start signal status by the signals of engine speed and battery voltage.

*2: This signal is sent to the ECM through CAN communication line.

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses a ON/ OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.

Diagnostic Procedure

ABS000YT

1. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE POWER SUPPLY CIR-CUIT

- 1. Turn ignition switch OFF.
- 2. Disconnect EVAP canister purge volume control solenoid valve harness connector.
- 3. Turn ignition switch ON.

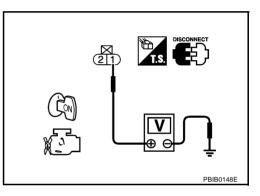

4. Check voltage between EVAP canister purge volume control solenoid valve terminal 1 and ground with CONSULT-II or tester.

Voltage: Battery voltage

OK or NG

OK >> GO TO 3. NG >> GO TO 2.

2. DETECT MALFUNCTIONING PART

Check the following.

- Harness connectors E12, F3
- IPDM E/R harness connector E8
- 15A fuse
- Harness for open or short between EVAP canister purge volume control solenoid valve and IPDM E/R
- Harness for open or short between EVAP canister purge volume control solenoid valve and ECM

>> Repair harness or connectors.

3. check evap canister purge volume control solenoid valve output signal circuit for open and short

- 1. Turn ignition switch OFF.
- 2. Disconnect ECM harness connector.
- 3. Check harness continuity between ECM terminal 45 and EVAP canister purge volume control solenoid valve terminal 2. Refer to Wiring Diagram.

Continuity should exist.

4. Also check harness for short to ground and short to power.

OK or NG

OK (With CONSULT-II)>>GO TO 4.

OK (Without CONSULT-II)>>GO TO 5.

NG >> Repair open circuit or short to ground or short to power in harness or connectors.

4. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE OPERATION

(P) With CONSULT-II

- Reconnect all harness connectors disconnected.
- 2. Start engine.
- Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with 3 CONSULT-II. Check that engine speed varies according to the valve opening.

OK or NG

- OK >> GO TO 6.

ABS000YV

DTC P0447 EVAP CANISTER VENT CONTROL VALVE

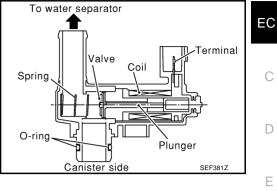

Component Description

The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.

This solenoid valve responds to signals from the ECM. When the ECM sends an ON signal, the coil in the solenoid valve is energized. A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.

This solenoid value is used only for diagnosis, and usually remains opened.

When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System" diagnosis.

Component Inspection EVAP CONTROL SYSTEM PRESSURE SENSOR

ABS000ZG

- 1. Remove EVAP control system pressure sensor with its harness connector connected from EVAP canister. **Do not reuse the O-ring, replace it with a new one.**
- 2. Install a vacuum pump to EVAP control system pressure sensor.
- 3. Turn ignition switch ON and check output voltage between ECM terminal 32 and ground under the following conditions.

Applied vacuum kPa (mmHg, inHg)	Voltage V
Not applied	1.8 - 4.8
-26.7 (-200, -7.87)	2.1 to 2.5V lower than above value

CAUTION:

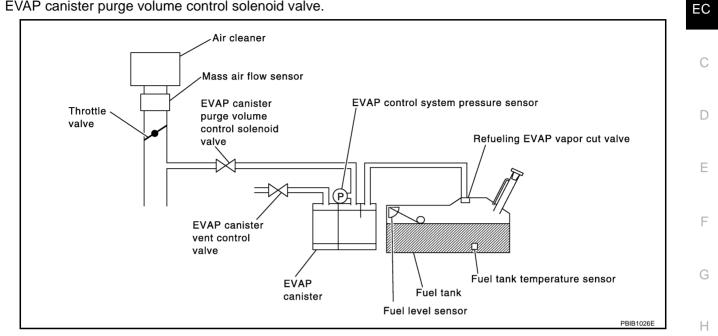

- Always calibrate the vacuum pump gauge when using it.
- Do not apply below -93.3 kPa (-700 mmHg, -27.56 inHg) or pressure over 101.3 kPa (760 mmHg, 29.92 inHg).
- 4. If NG, replace EVAP control system pressure sensor.

DTC P0455 EVAP CONTROL SYSTEM

On Board Diagnosis Logic

This diagnosis detects a very large leak (fuel filler cap fell off etc.) in EVAP system between the fuel tank and EVAP canister purge volume control solenoid valve.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
			• Fuel filler cap remains open or fails to close.
			 Incorrect fuel tank vacuum relief valve
			 Incorrect fuel filler cap used
			 Foreign matter caught in fuel filler cap.
			 Leak is in line between intake manifold and EVAP canister purge volume control solenoid valve.
		VAP control system ross leak detected EVAP control system has a very large leak such as fuel filler cap fell off, EVAP control sys- tem does not operate properly.	 Foreign matter caught in EVAP canister vent control valve.

DTC P0455 EVAP CONTROL SYSTEM

CAUTION:

- Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.
- If the fuel filler cap is not tightened properly, the MIL may come on.
- Use only a genuine NISSAN rubber tube as a replacement.

DTC Confirmation Procedure

ABS000ZX

CAUTION:

Never remove fuel filler cap during the DTC Confirmation Procedure.

NOTE:

- Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valve properly.
- If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

- Perform "DTC WORK SUPPORT" when the fuel level is between 1/4 and 3/4 full, and vehicle is placed on flat level surface.
- Open engine hood before conducting the following procedures.

WITH CONSULT-II

- 1. Tighten fuel filler cap securely until ratcheting sound is heard.
- 2. Turn ignition switch ON.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- Make sure that the following conditions are met. COOLAN TEMP/S: 0 - 70°C (32 - 158°F) INT/A TEMP SE: 0 - 60°C (32 - 140°F)
- Select "EVAP SML LEAK P0442/P1442" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT-II.

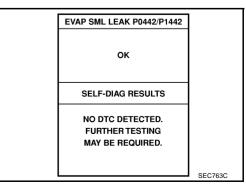

Follow the instruction displayed.

DTC P0456 EVAP CONTROL SYSTEM

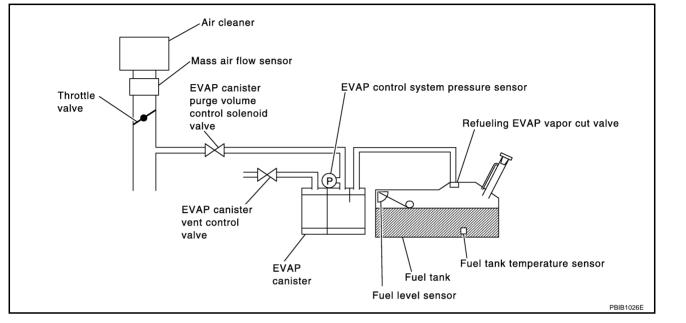

On Board Diagnosis Logic

This diagnosis detects very small leaks in the EVAP line between fuel tank and EVAP canister purge volume control solenoid valve, using the intake manifold vacuum in the same way as conventional EVAP small leak diagnosis.

If ECM judges a leak which corresponds to a very small leak, the very small leak P0456 will be detected.

If ECM judges there are no leaks, the diagnosis will be OK.

			 ORVR system leaks
			 Fuel level sensor and the circuit
			 Foreign matter caught in EVAP canister purge vol- ume control solenoid valve

CAUTION:

- Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.
- If the fuel filler cap is not tightened properly, the MIL may come on.
- Use only a genuine NISSAN rubber tube as a replacement.

DTC Confirmation Procedure

NOTE:

- ABS00100
- If DTC P0456 is displayed with P0442, first perform trouble diagnosis for DTC P0456.
- After repair, make sure that the hoses and clips are installed properly.
- If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

- Open engine hood before conducting following procedure.
- If any of following conditions are met just before the DTC confirmation procedure, leave the vehicle for more than 1 hour.
- Fuel filler cap is removed.
- Refilled or drained the fuel.
- EVAP component parts is/are removed.
- Before performing the following procedure, confirm that battery voltage is more than 11V at idle.

(I) WITH CONSULT-II

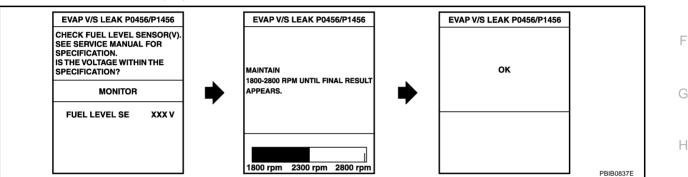

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 2. Make sure the following conditions are met.

FUEL LEVEL SE: 0.25 - 1.4V COOLAN TEMP/S: 0 - 32°C (32 - 90°F) FUEL T/TMP SE: 0 - 35°C (32 - 95°F) INT A/TEMP SE: More than 0°C (32°F) If NG turn ignition switch OFE and leave the

If NG, turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle) or refilling/draining fuel until the output voltage condition of the "FUEL LEVEL SE" meets within the range above and leave the vehicle for more than 1 hour. Then start from step 1).

- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Turn ignition switch ON.
- 5. Select "EVAP V/S LEAK P0456/P1456" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT-II.

Follow the instruction displayed.

 Make sure that "OK" is displayed. If "NG" is displayed, refer to <u>EC-370, "Diagnostic Procedure"</u>.

NOTE:

- If the engine speed cannot be maintained within the range displayed on CONSULT-II screen, go to <u>EC-77, "Basic Inspection"</u>.
- Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valve properly.

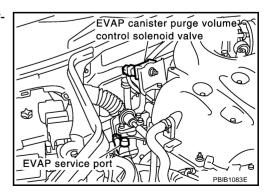

Overall Function Check

WITH GST

Use this procedure to check the overall function of the EVAP very small leak function. During this check, a DTC might not be confirmed.

CAUTION:

- Never use compressed air, doing so may damage the EVAP system.
- Do not start engine.
- Do not exceeded 4.12 kPa (0.042 kg/cm², 0.6 psi).
- 1. Attach the EVAP service port adapter securely to the EVAP service port.

А

DTC P0460 FUEL LEVEL SENSOR

Component Description

The fuel level sensor is mounted in the fuel level sensor unit. The sensor detects a fuel level in the fuel tank and transmits a signal to the unified meter and A/C amp. The unified meter and A/C amp. sends the fuel level sensor signal to the ECM through CAN communication line.

It consists of two parts, one is mechanical float and the other is variable resistor. Fuel level sensor output voltage changes depending on the movement of the fuel mechanical float.

On Board Diagnosis Logic

NOTE:

If DTC P0460 is displayed with DTC U1000 or U1001, first perform the trouble diagnosis for DTC U1000, U1001. Refer to <u>EC-136</u>.

When the vehicle is parked, naturally the fuel level in the fuel tank is stable. It means that output signal of the fuel level sensor does not change. If ECM senses sloshing signal from the sensor, fuel level sensor malfunction is detected.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0460 0460	Fuel level sensor circuit noise	Even though the vehicle is parked, a signal being varied is sent from the fuel level sensor	 Harness or connectors (The CAN communication line is open or shorted) Harness or connectors (The sensor circuit is open or shorted) 	F
		to ECM.	 Unified meter and A/C amp. Fuel level sensor 	

DTC Confirmation Procedure

NOTE:

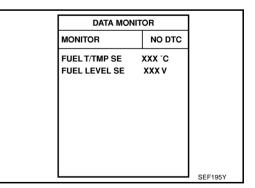

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

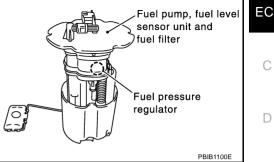

B WITH CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-II.

Follow the procedure "WITH CONSULT-II" above.

- 3. Start engine and wait maximum of 2 consecutive minutes.
- 4. If 1st trip DTC is detected, go to EC-378, "Diagnostic Procedure"

4850010B

On Board Diagnosis Logic

NOTE:

If DTC P0461 is displayed with DTC U1000 or U1001, first perform the trouble diagnosis for DTC U1000, U1001. Refer to EC-136.

Driving long distances naturally affect fuel gauge level.

This diagnosis detects the fuel gauge malfunction of the gauge not moving even after a long distance has been driven.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0461 0461	Fuel level sensor circuit range/performance	The output signal of the fuel level sensor does not change within the specified range even though the vehicle has been driven a long dis- tance.	 Harness or connectors (The CAN communication line is open or shorted) Harness or connectors (The sensor circuit is open or shorted) Unified meter and A/C amp. Fuel level sensor 	H

Overall Function Check

Use this procedure to check the overall function of the fuel level sensor function. During this check, a 1st trip DTC might not be confirmed.

WARNING:

When performing following procedure, be sure to observe the handling of the fuel. Refer to FL-11, "FUEL TANK" .

TESTING CONDITION:

Before starting overall function check, preparation of draining fuel and refilling fuel is required.

(I) WITH CONSULT-II

NOTE

Start from step 10, if it is possible to confirm that the fuel cannot be drained by 30 ℓ (7-7/8 US gal, 6-5/ 8 Imp gal) in advance.

- 1. Prepare a fuel container and a spare hose.
- Release fuel pressure from fuel line, refer to EC-44, "FUEL PRESSURE RELEASE". 2.
- 3. Remove the fuel feed hose on the fuel level sensor unit.
- 4. Connect a spare fuel hose where the fuel feed hose was removed.
- 5. Turn ignition switch OFF and wait at least 10 seconds then turn ON.
- Select "FUEL LEVEL SE" in "DATA MONITOR" mode with CONSULT-II. 6.

DTC P0506 ISC SYSTEM

Description

NOTE:

If DTC P0506 is displayed with other DTC, first perform the trouble diagnosis for the other DTC.

The ECM controls the engine idle speed to a specified level through the fine adjustment of the air, which is let into the intake manifold, by operating the electric throttle control actuator. The operating of the throttle valve is varied to allow for optimum control of the engine idling speed. The crankshaft position sensor (POS) detects the actual engine speed and sends a signal to the ECM.

The ECM controls the electric throttle control actuator so that the engine speed coincides with the target value memorized in the ECM. The target engine speed is the lowest speed at which the engine can operate steadily. The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warming up, deceleration, and engine load (air conditioner, power steering and cooling fan operation, etc.).

On Board Diagnosis Logic

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0506 0506	Idle speed control sys- tem RPM lower than expected	The idle speed is less than the target idle speed by 100 rpm or more.	Electric throttle control actuatorIntake air leak	F

DTC Confirmation Procedure

NOTE:

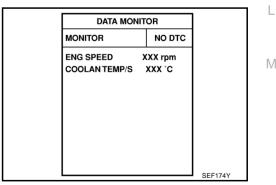

- If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.
- If the target idle speed is out of the specified value, perform <u>EC-42, "Idle Air Volume Learning"</u>, before conducting DTC Confirmation Procedure. For the target idle speed, refer to <u>EC-640, "SER-VICE DATA AND SPECIFICATIONS (SDS)"</u>.

TESTING CONDITION:

- Before performing the following procedure, confirm that battery voltage is more than 11V at idle.
- Always perform the test at a temperature above –10°C (14°F).

B WITH CONSULT-II

- 1. Open engine hood.
- 2. Start engine and warm it up to normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Turn ignition switch ON again and select "DATA MONITOR" mode with CONSULT-II.
- 5. Start engine and run it for at least 1 minute at idle speed.
- 6. If 1st trip DTC is detected, go to EC-386, "Diagnostic Procedure"

DTC P0550 PSP SENSOR

Component Description

Power steering pressure (PSP) sensor is installed to the power steering high-pressure tube and detects a power steering load. This sensor is a potentiometer which transforms the power steering load into output voltage, and emits the voltage signal to the ECM. The ECM controls the electric throttle control actuator and adjusts the throttle valve opening angle to increase the engine speed and adjusts the idle speed for the increased load.

DTC P0605 ECM

Component Description The ECM consists of a microcomputer and connectors for signal input and output and for power supply. The ECM controls the engine.

On Board Diagnosis Logic

This self-diagnosis has one or two trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition		Possible cause	
P0605 0605 E	Engine control module	A)	ECM calculation function is malfunctioning.		
		B)	ECM EEP-ROM system is malfunctioning.	• ECM	
		C)	ECM self shut-off function is malfunctioning.		

FAIL-SAFE MODE

ECM enters fail-safe mode when the malfunction A is detected.

Detected items	Engine operation condition in fail-safe mode			
Malfunction A	• ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.			
	ECM deactivates ASCD operation.			

DTC Confirmation Procedure

Perform PROCEDURE FOR MALFUNCTION A first. If the 1st trip DTC cannot be confirmed, perform PROCEDURE FOR MALFUNCTION B. If there is no malfunction on PROCEDURE FOR MALFUNCTION B, perform PROCEDURE FOR MALFUNCTION C.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

PROCEDURE FOR MALFUNCTION A

With CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-II.

DTC P1065 ECM POWER SUPPLY

Component Description

Battery voltage is supplied to the ECM even when the ignition switch is turned OFF for the ECM memory function of the DTC memory, the air-fuel ratio feedback compensation value memory, the idle air volume learning value memory, etc.

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

B WITH CONSULT-II

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Start engine and let it idle for 1 second.
- 4. Turn ignition switch OFF, wait at least 10 seconds, and then turn ON.
- 5. Repeat steps 3 and 4 four times.
- 6. If 1st trip DTC is detected, go to EC-399, "Diagnostic Procedure"

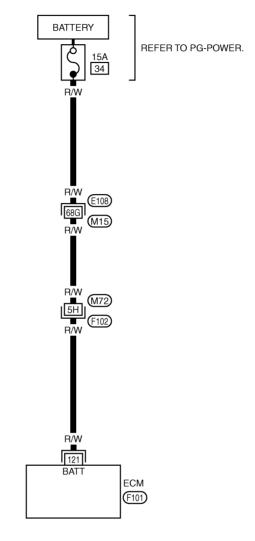

WITH GST

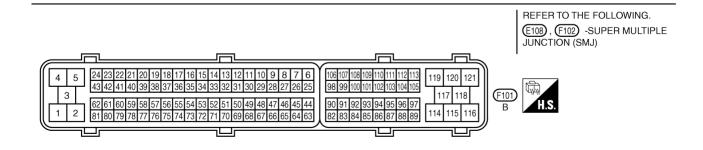

Follow the procedure "WITH CONSULT-II" above.

- 4. Perform EC-42, "Throttle Valve Closed Position Learning" .
- 5. Perform EC-42, "Idle Air Volume Learning" .

>> INSPECTION END

Component Description

Intake valve timing control solenoid valve is activated by ON/OFF pulse duty (ratio) signals from the ECM.

The intake valve timing control solenoid valve changes the oil amount and direction of flow through intake valve timing control unit or stops oil flow.

The longer pulse width advances valve angle.

The shorter pulse width retards valve angle.

When ON and OFF pulse widths become equal, the solenoid valve stops oil pressure flow to fix the intake valve angle at the control position.

CONSULT-II Reference Value in Data Monitor Mode

DTC P1121 ELECTRIC THROTTLE CONTROL ACTUATOR

Component Description

Electric Throttle Control Actuator consists of throttle control motor, throttle position sensor, etc. The throttle control motor is operated by the ECM and it opens and closes the throttle valve.

The throttle position sensor detects the throttle valve position, and the opening and closing speed of the throttle valve and feeds the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

ABS00111

ABS0011J

PFP:16119

ABS0011H

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name		DTC detecting condition	Possible cause
P1121	Electric throttle control	A)	Electric throttle control actuator does not func- tion properly due to the return spring malfunc- tion.	
1121	actuator	B)	Throttle valve opening angle in fail-safe mode is not in specified range.	Electric throttle control actuator
		C)	ECM detects the throttle valve is stuck open.	

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Detected items	Engine operating condition in fail-safe mode
Malfunction A	ECM controls the electric throttle actuator by regulating the throttle opening around the idle position. The engine speed will not rise more than 2,000 rpm.
Malfunction B	ECM controls the electric throttle control actuator by regulating the throttle opening to 20 degrees or less.
Malfunction C	While the vehicle is driving, it slows down gradually by fuel cut. After the vehicle stops, the engine stalls. The engine can restart in N or P position, and engine speed will not exceed 1,000 rpm or more.

DTC Confirmation Procedure

NOTE:

- Perform PROCEDURE FOR MALFUNCTION A AND B first. If the 1st trip DTC cannot be confirmed, perform PROCEDURE FOR MALFUNCTION C.
- If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

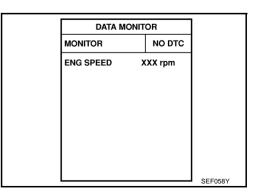

PROCEDURE FOR MALFUNCTION A AND B

With CONSULT-II

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- Shift selector lever to D position (A/T) or 1st position (M/T), and wait at least 2 seconds.
- 4. Shift selector lever to P position (A/T) or Neutral position (M/T).
- 5. Turn ignition switch OFF and wait at least 10 seconds.
- 6. Turn ignition switch ON and wait at least 1 second.
- 7. Shift selector lever to D position (A/T) or 1st position (M/T), and wait at least 2 seconds.
- 8. Shift selector lever to P position (A/T) or Neutral position (M/T).
- Turn ignition switch OFF, wait at least 10 seconds, and then turn ON.
- 10. If DTC is detected, go to EC-409, "Diagnostic Procedure" .

With GST

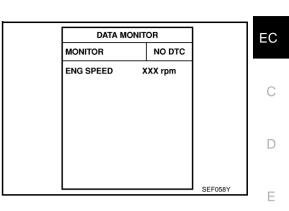

Follow the procedure "With CONSULT-II" above.

PROCEDURE FOR MALFUNCTION C

With CONSULT-II

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Shift selector lever to D position (A/T) or 1st position (M/T) and wait at least 2 seconds.
- 4. Shift selector lever to N, P position (A/T) or Neutral (M/T) position.
- 5. Start engine and let it idle for 3 seconds.
- 6. If DTC is detected, go to EC-409, "Diagnostic Procedure" .

@ With GST

Follow the procedure "With CONSULT-II" above.

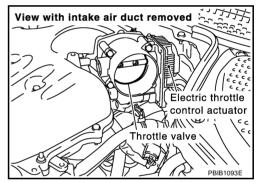

Diagnostic Procedure

1. CHECK ELECTRIC THROTTLE CONTROL ACTUATOR VISUALLY

- 1. Remove the intake air duct.
- 2. Check if a foreign matter is caught between the throttle valve and the housing.

OK or NG

- OK >> GO TO 2.
- NG >> Remove the foreign matter and clean the electric throttle control actuator inside.

2. REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

- 1. Replace the electric throttle control actuator.
- 2. Perform EC-42, "Throttle Valve Closed Position Learning" .
- 3. Perform EC-42, "Idle Air Volume Learning" .

Description

NOTE:

If DTC P1122 is displayed with DTC P1121 or 1126, first perform the trouble diagnosis for DTC P1121 or P1126. Refer to <u>EC-408</u> or <u>EC-417</u>.

Electric Throttle Control Actuator consists of throttle control motor, throttle position sensor, etc.

The throttle control motor is operated by the ECM and it opens and closes the throttle valve.

The current opening angle of the throttle valve is detected by the throttle position sensor and it provides feedback to the ECM to control the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

This self-diagnosis has the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1122 1122	Electric throttle control performance problem	Electric throttle control function does not oper- ate properly.	 Harness or connectors (Throttle control motor circuit is open or shorted) Electric throttle control actuator

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operating condition in fail-safe mode

ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.

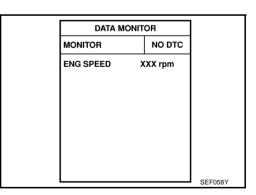

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

B WITH CONSULT-II

- 1. Turn ignition switch ON and wait at least 2 seconds.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Start engine and let it idle for 5 seconds.
- 4. If DTC is detected, go to EC-412, "Diagnostic Procedure".

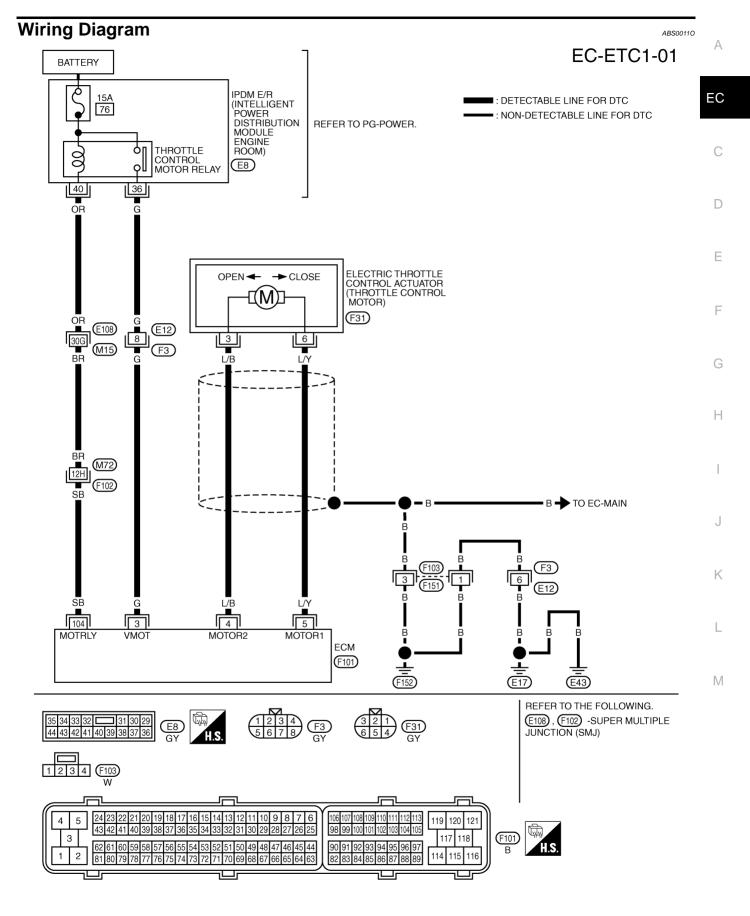

WITH GST

Follow the procedure "WITH CONSULT-II" above.

PFP:16119

DTC P1124, P1126 THROTTLE CONTROL MOTOR RELAY

Component Description

Power supply for the throttle control motor is provided to the ECM via throttle control motor relay. The throttle control motor relay is ON/OFF controlled by the ECM. When the ignition switch is turned ON, the ECM sends an ON signal to throttle control motor relay and battery voltage is provided to the ECM. When the ignition switch is turned OFF, the ECM sends an OFF signal to throttle control motor relay and battery voltage is not provided to the ECM.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION
THRTL RELAY	Ignition switch: ON	ON

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	F

DTC P1143, P1163 HO2S1

Component Description

The heated oxygen sensor 1 is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The heated oxygen sensor 1 has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The heated oxygen sensor 1 signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1 to 0V.

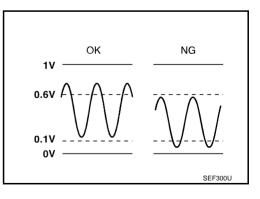

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION	J
HO2S1 (B1) HO2S1 (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$	
HO2S1 MNTR (B1) HO2S1 MNTR (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	LEAN $\leftarrow \rightarrow$ RICH Changes more than 5 times during 10 seconds.	К

On Board Diagnosis Logic

To judge the malfunction, the output from the heated oxygen sensor 1 is monitored to determine whether the "rich" output is sufficiently high and whether the "lean" output is sufficiently low. When both the outputs are shifting to the lean side, the malfunction will be detected.

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

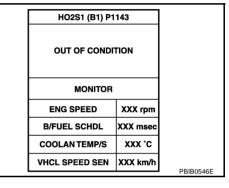

TESTING CONDITION:

- Always perform at a temperature above -10°C (14°F).
- Before performing following procedure, confirm that battery voltage is more than 11V at idle.

WITH CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Stop engine and wait at least 10 seconds.
- 3. Turn ignition switch ON and select "HO2S1 (B1) P1143" of "HO2S1" or "HO2S1 (B2) P1163" of "HO2S1" in "DTC WORK SUPPORT" mode with CONSULT-II.
- 4. Touch "START".
- 5. Start engine and let it idle for at least 3 minutes. **NOTE:**

Never raise engine speed above 3,600 rpm after this step. If the engine speed limit is exceeded, return to step 5.

6. When the following conditions are met, "TESTING" will be displayed on the CONSULT-II screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 40 seconds or more.)

ENG SPEED	1,200 - 2,600 rpm
Vehicle speed	Less than 100 km/h (62 MPH)
B/FUEL SCHDL	2.5 - 12.0 msec
Selector lever	Suitable position

If "TESTING" is not displayed after 5 minutes, retry from step 2.

 Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-429</u>, "<u>Diagnostic</u> <u>Procedure</u>".

DTC P1146, P1166 HO2S2

Component Description

The heated oxygen sensor 2, after three way catalyst 1, monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the heated oxygen sensor 1 are shifted, the air-fuel ratio is controlled to stoichiometric, by the signal from the heated oxygen sensor 2.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the heated oxygen sensor 2 is not used for engine control operation.

CONSULT-II Reference Value in Data Monitor Mode

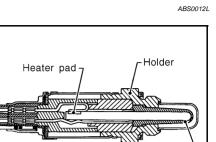

Specification data are reference values.

MONITOR ITEM	CON	NDITION	SPECIFICATION
HO2S2 (B1) HO2S2 (B2)	Warm-up conditionAfter keeping engine speed	Revving engine from idle to 3,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$
HO2S2 MNTR (B1) HO2S2 MNTR (B2)	between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load.	quickly.	$LEAN \leftarrow \rightarrow RICH$

On Board Diagnosis Logic

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the heated oxygen sensor 1. The oxygen storage capacity of the three way catalyst causes the longer switching time. To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the minimum voltage of sensor is sufficiently low during the various driving condition such as fuel-cut.

DTC Confirmation Procedure

NOTE:

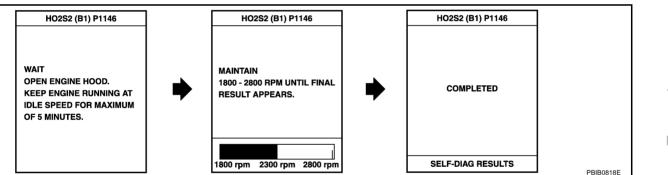

If DTC confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

WITH CONSULT-II

TESTING CONDITION:

For better results, perform "DTC WORK SUPPORT" at a temperature of 0 to 30 °C (32 to 86 °F).

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 2. Start engine and warm it up to the normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 5. Let engine idle for 1 minute.
- Make sure that "COOLAN TEMP/S" indicates more than 70°C (158°F).
 If not, warm up engine and go to next step when "COOLAN TEMP/S" indication reaches to 70°C (158°F).
- 7. Open engine hood.
- 8. Select "HO2S2 (B1) P1146" or "HO2S2 (B2) P1166" of "HO2S2" in "DTC WORK SUPPORT" mode with CONSULT-II.
- 9. Start engine and following the instruction of CONSULT-II.

 Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-446</u>, "<u>Diagnostic Procedure</u>".

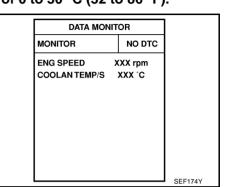

- If "CAN NOT BE DIAGNOSED" is displayed, perform the following.
- a. Turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle).
- b. Return to step 1.

Overall Function Check

Use this procedure to check the overall function of the heated oxygen sensor 2 circuit. During this check, a DTC might not be confirmed.

(a) WITH GST

- 1. Start engine and warm it up to the normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 4. Let engine idle for 1 minute.
- 5. Set voltmeter probes between ECM terminal 74 [HO2S2 (B1) signal] or 55 [HO2S2 (B2) signal] and engine ground.

- 1. Turn ignition switch OFF.
- 2. Loosen and retighten engine ground screws.

>> GO TO 2.

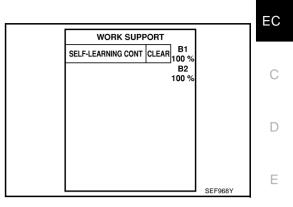

ABS0012R

2. CLEAR THE SELF-LEARNING DATA

With CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Select "SELF-LEARNING CONT" in "WORK SUPPORT" mode with CONSULT-II.
- 3. Clear the self-learning control coefficient by touching "CLEAR".
- 4. Run engine for at least 10 minutes at idle speed. Is the 1st trip DTC P0172 or P0175 detected? Is it difficult to start engine?

Without CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF.
- 3. Disconnect mass air flow sensor harness connector, and restart and run engine for at least 5 seconds at idle speed.
- 4. Stop engine and reconnect mass air flow sensor harness connector.
- 5. Make sure DTC P0102 is displayed.
- 6. Erase the DTC memory. Refer to <u>EC-60, "HOW TO ERASE</u> <u>EMISSION-RELATED DIAGNOSTIC INFORMATION"</u>.
- 7. Make sure DTC P0000 is displayed.
- 8. Run engine for at least 10 minutes at idle speed. Is the 1st trip DTC P0172 or P0175 detected? Is it difficult to start engine?

Yes or No

Yes \rightarrow Perform trouble diagnosis for DTC P0172, P0175. Refer to <u>EC-259</u>. No \rightarrow GO TO 3.

3. CHECK HO2S2 GROUND CIRCUIT FOR OPEN AND SHORT

- 1. Turn ignition switch OFF.
- 2. Disconnect ECM harness connector.
- 3. Disconnect heated oxygen sensor 2 harness connector.
- 4. Check harness continuity between HO2S2 terminal 4 and ECM terminal 78.

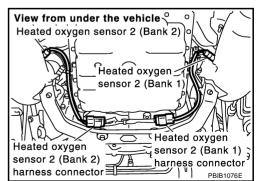

Refer to Wiring Diagram.

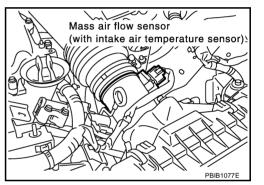

Continuity should exist.

5. Also check harness for short to ground and short to power. OK or NG

OK >> GO TO 4.

NG >> Repair open circuit or short to ground or short to power in harness or connectors.

DTC P1146, P1166 HO2S2

Removal and Installation HEATED OXYGEN SENSOR 2

Refer to EM-23, "EXHAUST MANIFOLD AND THREE WAY CATALYST" .

ABS0012T

DTC P1147, P1167 HO2S2

DTC P1147, P1167 HO2S2

Component Description

The heated oxygen sensor 2, after three way catalyst 1, monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the heated oxygen sensor 1 are shifted, the air-fuel ratio is controlled to stoichiometric, by the signal from the heated oxygen sensor 2.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the heated oxygen sensor 2 is not used for engine control operation.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

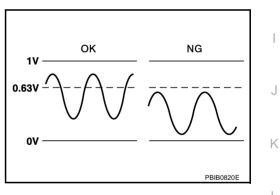

MONITOR ITEM	CON	IDITION	SPECIFICATION	
HO2S2 (B1) HO2S2 (B2)	Warm-up conditionAfter keeping engine speed	Revving engine from idle to 3,000 rpm	$0 - 0.3V \leftrightarrow Approx. 0.6 - 1.0V$	_
HO2S2 MNTR (B1) HO2S2 MNTR (B2)	between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load.	quickly.	$LEAN \leftarrow \rightarrow RICH$	_

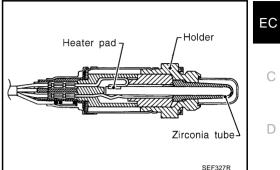

On Board Diagnosis Logic

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the heated oxygen sensor 1. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the maximum voltage of the sensor is sufficiently high during the various driving condition such as fuel-cut.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P1147 1147 (Bank 1)	Heated oxygen sensor	The maximum voltage from the sensor is not	 Harness or connectors (The sensor circuit is open or shorted) Heated oxygen sensor 2 	-

DTC Confirmation Procedure

NOTE:

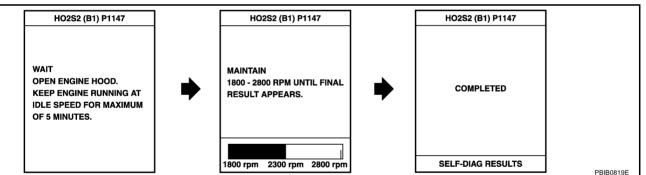

If DTC confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

WITH CONSULT-II

TESTING CONDITION:

For better results, perform "DTC WORK SUPPORT" at a temperature of 0 to 30 °C (32 to 86 °F).

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-II.
- 2. Start engine and warm it up to the normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 5. Let engine idle for 1 minute.
- Make sure that "COOLAN TEMP/S" indicates more than 70°C (158°F).
 If not, warm up engine and go to next step when "COOLAN TEMP/S" indication reaches to 70°C (158°F).
- 7. Open engine hood.
- 8. Select "HO2S2 (B1) P1147" or "HO2S2 (B2) P1167" of "HO2S2" in "DTC WORK SUPPORT" mode with CONSULT-II.
- 9. Start engine and following the instruction of CONSULT-II.

10. Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-457, "Diagnostic Procedure"</u>.

- If "CAN NOT BE DIAGNOSED" is displayed, perform the following.
- a. Turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle).
- b. Return to step 1.

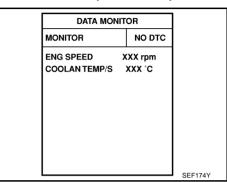

Overall Function Check

ABS0012Y

Use this procedure to check the overall function of the heated oxygen sensor 2 circuit. During this check, a DTC might not be confirmed.

(a) WITH GST

- 1. Start engine and warm it up to the normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 4. Let engine idle for 1 minute.
- 5. Set voltmeter probes between ECM terminal 74 [HO2S2 (B1) signal] or 55 [HO2S2 (B2) signal] and engine ground.

6. Check the voltage when revving up to 4,000 rpm under no load at least 10 times.

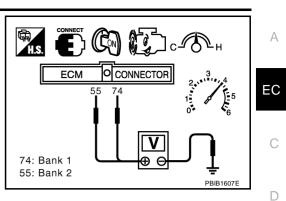

(Depress and release accelerator pedal as soon as possible.) The voltage should be above 0.63V at least once during this procedure.

If the voltage can be confirmed in step 6, step 7 is not necessary.

 Keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in D position (A/T), 4th gear position (M/T).
 The voltage should be above 0.63V at least once during this

The voltage should be above 0.63V at least once during this procedure.

8. If NG, go to EC-457, "Diagnostic Procedure" .

DTC P1148, P1168 CLOSED LOOP CONTROL

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1148 1148 (Bank 1)	Closed loop control	The closed loop control function for bank 1 does not operate even when vehicle is driving in the specified condition.	 The heated oxygen sensor 1 circuit is open or shorted.
P1168 1168 (Bank 2)	function	The closed loop control function for bank 2 does not operate even when vehicle is driving in the specified condition.	Heated oxygen sensor 1Heated oxygen sensor heater

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE: If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

- Never raise engine speed above 3,600 rpm during the DTC Confirmation Procedure. If the engine speed limit is exceeded, retry the procedure from step 2.
- Before performing the following procedure, confirm that battery voltage is more than 11V at idle.

B WITH CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Hold engine speed at 2,000 rpm and check one of the following.
- "HO2S1 (B1)/(B2)" voltage should go above 0.70V at least once.
- "HO2S1 (B1)/(B2)" voltage should go below 0.21V at least once. If the check result is NG, perform <u>EC-463</u>, "<u>Diagnostic Proce-</u> <u>dure</u>".

If the check result is OK, perform the following step.

- 4. Let engine idle at least 5 minutes.
- 5. Maintain the following condition at least 50 consecutive seconds.

B/FUEL SCHDL	2.5 msec or more
ENG SPEED	More than 1,500 rpm
Selector lever	Suitable position
VHCL SPEED SE	More than 70 km/h (43 MPH)

During this test, P0132 and/or P0152 may be displayed on CONSULT-II screen.

6. If DTC is detected, go to EC-463, "Diagnostic Procedure".

Overall Function Check

Use this procedure to check the overall function of the closed loop control. During this check, a DTC might not be confirmed.

DTC P1217 ENGINE OVER TEMPERATURE

DTC P1217 ENGINE OVER TEMPERATURE

Description SYSTEM DESCRIPTION

PFP:00000

ABS0095R

NOTE:

If DTC P1217 is displayed with DTC U1000 or U1001, first perform the trouble diagnosis for DTC U1000, U1001. Refer to <u>EC-136, "DTC U1000, U1001 CAN COMMUNICATION LINE"</u>.

Cooling Fan Control

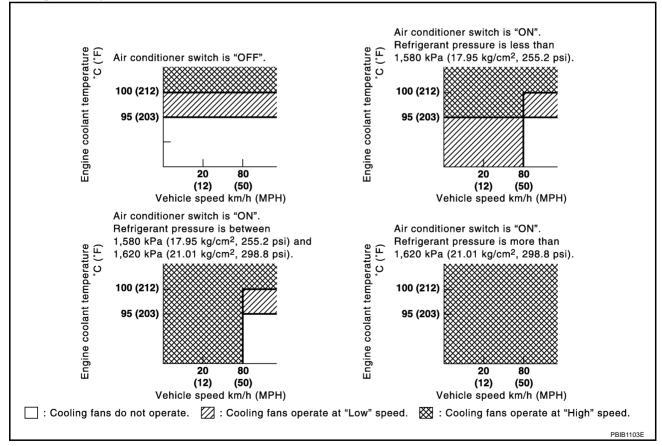

Sensor	Input Signal to ECM	ECM function	Actuator
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed* ¹		
Battery	Battery voltage*1	-	
Wheel sensor	Vehicle speed*2	Cooling fan control	IPDM E/R (Cooling fan relays)
Engine coolant temperature sensor	Engine coolant temperature	oontrol	(Cooling lan rolayo)
Air conditioner switch	Air conditioner ON signal* ²		
Refrigerant pressure sensor	Refrigerant pressure	-	

*1: The ECM determines the start signal status by the signals of engine speed and battery voltage.

*2: This signal is sent to ECM through CAN communication line.

The ECM controls the cooling fan corresponding to the vehicle speed, engine coolant temperature, refrigerant pressure, and air conditioner ON signal. The control system has 3-step control [HIGH/LOW/OFF].

Cooling Fan Operation

DTC P1217 ENGINE OVER TEMPERATURE

Cooling Fan Relay Operation

The ECM controls cooling fan relays in the IPDM E/R through CAN communication line.

Cooling for aroud		Cooling fan relay		
Cooling fan speed	1	2	3	EC
Stop	OFF	OFF	OFF	
Low	ON	OFF	OFF	
High	ON	ON	ON	С

COMPONENT DESCRIPTION

Cooling Fan Motor

The cooling fan operates at each speed when the current flows in the cooling fan motor as follows.

Cooling fan speed	Cooling fan motor terminals		
Cooling fail speed	(+)	(-)	
Low	1	3	
	2	4	
High	1 and 2	3 and 4	

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION	
	• Engine: After warming up idle	Air conditioner switch: OFF	OFF	
AIR COND SIG	• Engine: After warming up, idle the engine	Air conditioner switch: ON (Compressor operates.)	ON	
COOLING FAN	 Engine: After warming up, idle the engine Air conditioner switch: OFF 	Engine coolant temperature is 94°C (201°F) or less	OFF	
		Engine coolant temperature is between 95°C (203°F) and 99°C (210°F)	LOW	
		Engine coolant temperature is 100°C (212°F) or more	н	

On Board Diagnosis Logic

If the cooling fan or another component in the cooling system malfunctions, engine coolant temperature will rise.

When the engine coolant temperature reaches an abnormally high temperature condition, a malfunction is indicated.

This self-diagnosis has the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1217 1217	Engine over tempera- ture (Overheat)	 Cooling fan does not operate properly (Overheat). Cooling fan system does not operate properly (Overheat). Engine coolant was not added to the system using the proper filling method. Engine coolant is not within the specified range. 	 Harness or connectors (The cooling fan circuit is open or shorted.) Cooling fan Radiator hose Radiator Radiator cap Water pump Thermostat For more information, refer to EC-478, "Main 12 Causes of Overheating".

CAUTION:

When a malfunction is indicated, be sure to replace the coolant. Refer to <u>CO-8</u>, <u>"Changing Engine</u> <u>Coolant"</u>. Also, replace the engine oil. Refer to <u>LU-8</u>, <u>"Changing Engine Oil"</u>.

- 1. Fill radiator with coolant up to specified level with a filling speed of 2 liters per minute. Be sure to use coolant with the proper mixture ratio. Refer to <u>MA-12</u>, <u>"ANTI-FREEZE COOLANT MIXTURE</u> <u>RATIO"</u>.
- 2. After refilling coolant, run engine to ensure that no water-flow noise is emitted.

Overall Function Check

ABS00319

Use this procedure to check the overall function of the cooling fan. During this check, a DTC might not be confirmed.

WARNING:

Never remove the radiator cap when the engine is hot. Serious burns could be caused by high pressure fluid escaping from the radiator.

Wrap a thick cloth around cap. Carefully remove the cap by turning it a quarter turn to allow built-up pressure to escape. Then turn the cap all the way off.

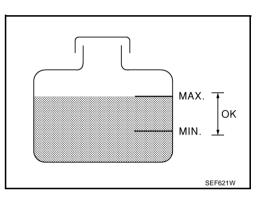

(P) WITH CONSULT-II

- Check the coolant level in the reservoir tank and radiator.
 Allow engine to cool before checking coolant level. If the coolant level in the reservoir tank and/or radiator is below the proper range, skip the following steps and go to <u>EC-472</u>, <u>"Diagnostic Procedure"</u>.
- Confirm whether customer filled the coolant or not. If customer filled the coolant, skip the following steps and go to <u>EC-472</u>, <u>"Diagnostic Procedure"</u>.

Perform "COOLING FAN" in "ACTIVE TEST" mode with CON-

5. If the results are NG, go to EC-472, "Diagnostic Procedure".

3. Turn ignition switch ON.

Diagnostic Procedure

Do you have CONSULT-II?

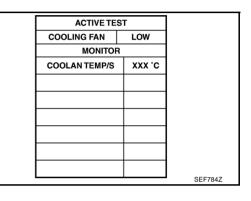

Yes or No

Yes >> GO TO 2. No >> GO TO 4.

2. CHECK COOLING FAN LOW SPEED OPERATION

With CONSULT-II

- 1. Start engine and let it idle.
- 2. Select "COOLING FAN" in "ACTIVE TEST" mode with CON-SULT-II and touch "LOW" on the CONSULT-II screen.
- 3. Make sure that cooling fans-1 and -2 operate at low speed. OK or NG
- OK >> GO TO 3.
- NG >> Check cooling fan low speed control circuit. (Go to <u>EC-475, "PROCEDURE A"</u>.)

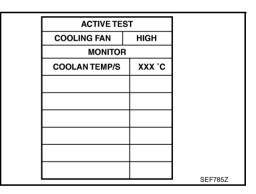

3. CHECK COOLING FAN HIGH SPEED OPERATION

With CONSULT-II

- 1. Touch "HIGH" on the CONSULT-II screen.
- 2. Make sure that cooling fans-1 and -2 operate at higher speed than low speed.

OK or NG

- OK >> GO TO 6.
- NG >> Check cooling fan high speed control circuit. (Go to $\underline{\text{EC-}}$ <u>477, "PROCEDURE B"</u>.)

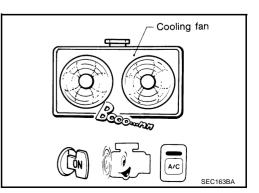

4. CHECK COOLING FAN LOW SPEED OPERATION

Without CONSULT-II

- 1. Start engine and let it idle.
- 2. Turn air conditioner switch ON.
- 3. Turn blower fan switch ON.
- 4. Make sure that cooling fans-1 and -2 operate at low speed.

OK or NG

- OK >> GO TO 5.
- NG >> Check cooling fan low speed control circuit. (Go to <u>EC-475, "PROCEDURE A"</u>.)

ABS0031B

5. CHECK COOLING FAN HIGH SPEED OPERATION

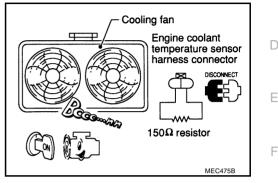

Without CONSULT-II

- 1. Turn ignition switch OFF.
- 2. Turn air conditioner switch and blower fan switch OFF.
- 3. Disconnect engine coolant temperature sensor harness connector.
- 4. Connect 150 Ω resistor to engine coolant temperature sensor harness connector.
- 5. Restart engine and make sure that cooling fans-1 and -2 operate at higher speed than low speed.

OK or NG

OK >> GO TO 6.

NG >> Check cooling fan high speed control circuit. (Go to EC-477, "PROCEDURE B" .)

6. CHECK COOLING SYSTEM FOR LEAK

Apply pressure to the cooling system with a tester, and check if the pressure drops.

Testing pressure: 157 kPa (1.6 kg/cm², 23 psi)

CAUTION:

Higher than the specified pressure may cause radiator damage. Pressure should not drop.

OK or NG

OK >> GO TO 7.

- NG >> Check the following for leak. Refer to CO-8, "LEAK CHECK".
 - Hose
 - Radiator
 - Water pump

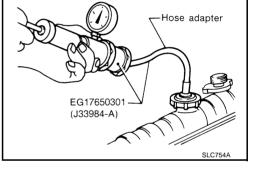

7. CHECK RADIATOR CAP

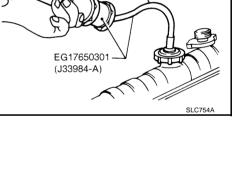

Apply pressure to cap with a tester.

Radiator cap relief pressure: 59 - 98 kPa (0.6 - 1.0 kg/cm² , 9 - 14 psi)

OK or NG

OK	>> GO TO 8.
NG	>> Replace radiator cap.

J

K

L

Revision: 2004 November

EC

8. CHECK THERMOSTAT

- 1. Check valve seating condition at normal room temperatures. **It should seat tightly.**
- 2. Check valve opening temperature and valve lift.

Valve opening temperature:76.5°C (170°F) [standard]Valve lift:More than 8.6 mm/90°C
(0.339 in/194°F)

 Check if valve is closed at 5°C (9°F) below valve opening temperature. For details, refer to <u>CO-23, "THERMOSTAT AND THERMO-STAT HOUSING"</u>.

OK or NG

OK >> GO TO 9.

NG >> Replace thermostat

9. CHECK ENGINE COOLANT TEMPERATURE SENSOR

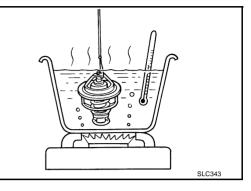

Refer to EC-182, "Component Inspection" .

- OK or NG
- OK >> GO TO 10.
- NG >> Replace engine coolant temperature sensor.

10. CHECK MAIN 12 CAUSES

If the cause cannot be isolated, go to EC-478, "Main 12 Causes of Overheating" .

>> INSPECTION END

PROCEDURE A

А 1. CHECK POWER SUPPLY CIRCUIT Turn ignition switch OFF. 1. EC 2. Disconnect IPDM E/R harness connectors E5 and E6. 3 Check voltage between IPDM E/R terminals 9, 16 and ground with CONSULT-II or tester. DETECT MALFUNCTIONING PART F Check the following. 40A fusible links Harness for open or short between IPDM E/R and battery Н >> Repair open circuit or short to ground or short to power in harness or connectors. 3. CHECK COOLING FAN MOTORS CIRCUIT 1. Disconnect cooling fan motor-1 harness connector and cooling fan motor-2 harness connector. Front 2. Check harness continuity between cooling fan motor-1 terminal 1 and IPDM E/R terminal 7, cooling fan motor-1 terminal 3 and around. Refer to wiring diagram. Κ Cooling fan motor-2 Continuity should exist. harness connector > Check harness continuity between cooling fan motor-2 terminal . M (Q 3. X 1 and IPDM E/R terminal 13, cooling fan motor-2 terminal 3 and Cooling fan motor-L π harness connector ground. PBIB1085F

Refer to wiring diagram.

Continuity should exist.

4. Also check harness for short to ground and short to power.

OK or NG

OK >> GO TO 5. NG >> GO TO 4. Μ

4. DETECT MALFUNCTIONING PART

Check the following.

- Harness connector E12, F3
- Harness connector F103, F151
- Harness for open or short between cooling fan motor-1 and IPDM E/R
- Harness for open or short between cooling fan motor-1 and ground
- Harness for open or short between cooling fan motor-2 and IPDM E/R
- Harness for open or short between cooling fan motor-2 and ground

>> Repair open circuit or short to ground or short to power in harness or connectors.

5. CHECK COOLING FAN MOTORS

Refer to EC-478, "Component Inspection" .

OK or NG

OK >> GO TO 6.

NG >> Replace cooling fan motors.

6. CHECK INTERMITTENT INCIDENT

Perform EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT" .

OK or NG

- OK >> Replace IPDM E/R. Refer to <u>PG-17, "IPDM E/R (INTELLIGENT POWER DISTRIBUTION MOD-ULE ENGINE ROOM)"</u>.
- NG >> Repair or replace harness or connector.

PROCEDURE B

1. CHECK COOLING FAN MOTORS CIRCUIT

- 1. Turn ignition switch OFF.
- 2. Disconnect cooling fan motor-1 harness connector and cooling fan motor-2 harness connector.
- Check harness continuity between the following; cooling fan motor-1 terminal 2 and IPDM E/R terminal 5, cooling fan motor-1 terminal 4 and IPDM E/R terminal 15, IPDM E/R terminal 14 and ground, IPDM E/R terminal 45 and ground. Refer to wiring diagram.

Continuity should exist.

 Check harness continuity between the following; cooling fan motor-2 terminal 2 and IPDM E/R terminal 10, cooling fan motor-2 terminal 4 and IPDM E/R terminal 12, IPDM E/R terminal 14 and ground, IPDM E/R terminal 45 and ground. Refer to wiring diagram.

Continuity should exist.

5. Also check harness for short to ground and short to power.

<u>OK or NG</u> OK >> GO TO 3. NG >> GO TO 2.

2. DETECT MALFUNCTIONING PART

Check the following.

- Harness connector E12, F3
- Harness connector F103, F151
- Harness for open or short between cooling fan motor-1 and IPDM E/R
- Harness for open or short between cooling fan motor-2 and IPDM E/R
- Harness for open or short between IPDM E/R and ground

>> Repair open circuit or short to ground or short to power in harness or connectors.

3. CHECK COOLING FAN MOTORS

Refer to EC-478, "Component Inspection" .

OK or NG

OK >> GO TO 4.

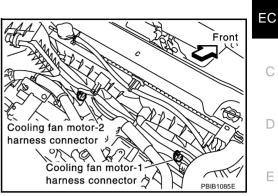

NG >> Replace cooling fan motors.

4. CHECK INTERMITTENT INCIDENT

Perform EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT" .

OK or NG

- OK >> Replace IPDM E/R. Refer to <u>PG-17, "IPDM E/R (INTELLIGENT POWER DISTRIBUTION MOD-ULE ENGINE ROOM)"</u>.
- NG >> Repair or replace harness connectors.

ABS0013L

DTC P1225 TP SENSOR

Component Description

Electric Throttle Control Actuator consists of throttle control motor, throttle position sensor, etc. The throttle position sensor responds to the throttle valve movement.

The throttle position sensor has the two sensors. These sensors are a kind of potentiometers which transform the throttle valve position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the throttle valve and feed the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

The MIL will not light up for this diagnosis.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	_
P1225 1225	Closed throttle position learning performance problem	Closed throttle position learning value is excessively low.	• Electric throttle control actuator (TP sensor 1 and 2)	(

DTC Confirmation Procedure

NOTE:

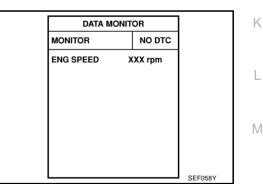

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 10V at idle.

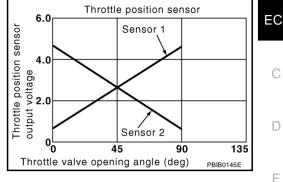

(P) WITH CONSULT-II

- 1. Turn ignition switch ON.
- 2 Select "DATA MONITOR" mode with CONSULT-II.
- 3. Turn ignition switch OFF, wait at least 10 seconds.

Heated oxygen sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	_	
Fuel tank temperature sensor	Fuel temperature in fuel tank		
Wheel sensor*2	Vehicle speed		

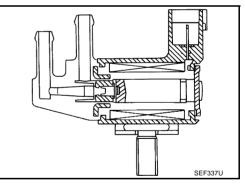

*1: ECM determines the start signal status by the signals of engine speed and battery voltage.

*2: This signal is sent to the ECM through CAN communication line.

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses a ON/ OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.

CONSULT-II Reference Value in Data Monitor Mode

DTC Confirmation Procedure

NOTE:

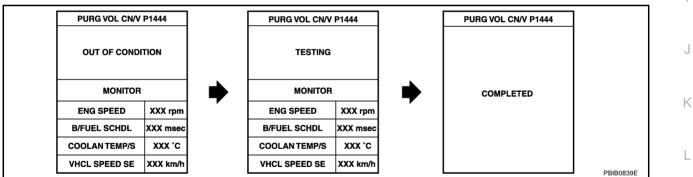

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

Always perform test at a temperature of 5°C (41°F) or more.

(I) WITH CONSULT-II

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Turn ignition switch ON.
- 4. Select "PURG VOL CN/V P1444" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT-II.
- 5. Touch "START".

6. Start engine and let it idle until "TESTING" on CONSULT-II changes to "COMPLETED". (It will take approximately 10 seconds.)

If "TESTING" is not displayed after 5 minutes, retry from step 2.

7. Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-492</u>, "Diagnostic Procedure".

WITH GST

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Start engine and let it idle for at least 20 seconds.
- 4. Select "MODE 7" with GST.
- 5. If 1st trip DTC is detected, go to EC-492, "Diagnostic Procedure" .

DTC P1446 EVAP CANISTER VENT CONTROL VALVE

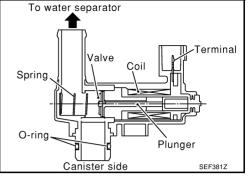

Component Description

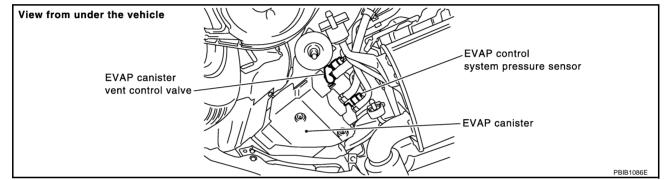

The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.

This solenoid valve responds to signals from the ECM. When the ECM sends an ON signal, the coil in the solenoid valve is energized. A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.

This solenoid value is used only for diagnosis, and usually remains opened.

When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System" diagnosis.

CONSULT-II Reference Value in Data Monitor Mode

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

- If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.
- Procedure for malfunction B is not described here. It takes extremely long time to complete procedure for malfunction B. By performing procedure for malfunction A, the incident that causes malfunction B can be detected.

TESTING CONDITION:

Steps 4 and 5 may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a D road test is expected to be easier, it is unnecessary to lift the vehicle.

(E) WITH CONSULT-II

- 1. Start engine (TCS switch OFF).
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- Press MAIN switch and make sure that CRUISE indicator lights up.
- 4. Drive the vehicle for at least 5 consecutive seconds under the following condition.

VHCL SPEED SE	More than 30 km/h (19 MPH)
Shift lever	Suitable position

If 1st trip DTC is detected, go to EC-515, "Diagnostic Procedure"

If 1st trip DTC is not detected, go to the following step.

5. Drive the vehicle for at least 5 consecutive seconds under the following condition.

VHCL SPEED SE	More than 30 km/h (19 MPH)
Shift lever	Suitable position
Driving location	Depress the brake pedal for more than five seconds so as not to come off from the above-mentioned vehicle speed.

6. If 1st trip DTC is detected, go to EC-515, "Diagnostic Procedure" .

Diagnostic Procedure

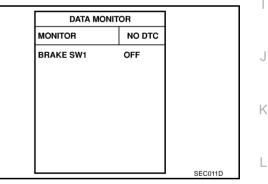

A/T MODELS

1. CHECK OVERALL FUNCTION-I

(P) With CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "BRAKE SW1" in "DATA MONITOR" mode with CONSULT-II.
- 3. Check "BRAKE SW1" indication under the following conditions.

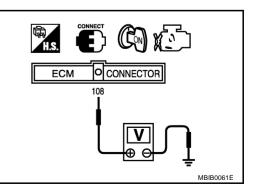

CONDITION	INDICATION
When brake pedal is depressed	OFF
When brake pedal is fully released	ON

Without CONSULT-II

- 1. Turn ignition switch ON.
- 2. Check voltage between ECM terminal 108 and ground under the following conditions.

CONDITION	VOLTAGE
When brake pedal is depressed	Approximately 0V
When brake pedal is fully released	Battery voltage

<u>OK or NG</u> OK >> GO TO 2. NG >> GO TO 3.

DTC P1572 ASCD BRAKE SWITCH

$\overline{\mathbf{3}}$. CHECK ASCD BRAKE SWITCH POWER SUPPLY CIRCUIT

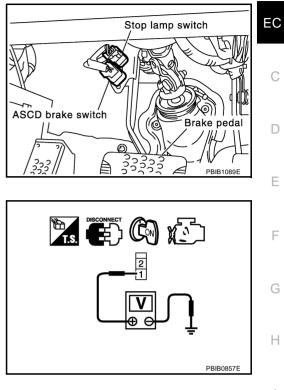

- 1. Turn ignition switch OFF.
- 2. Disconnect ASCD brake switch harness connector.
- 3. Turn ignition switch ON.

4. Check voltage between ASCD brake switch terminal 1 and ground with CONSULT-II or tester.

Voltage: Battery voltage

OK or NG

OK >> GO TO 5. NG >> GO TO 4.

4. DETECT MALFUNCTIONING PART Check the following. Fuse block (J/B) connector E101 10A fuse Harness for open or short between ASCD brake switch and fuse Κ >> Repair open circuit or short to ground or short to power in harness or connectors. 5. CHECK ASCD BRAKE SWITCH INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT Т Turn ignition switch OFF. 1. 2. Disconnect ECM harness connector. Μ

Check harness continuity between ECM terminal 108 and ASCD brake switch terminal 2. 3. Refer to Wiring Diagram.

Continuity should exist.

4. Also check harness for short to ground and short to power.

OK or NG

OK	>> GO TO 7.
NG	>> GO TO 6.

6. DETECT MALFUNCTIONING PART

Check the following.

- Harness connectors E108, M15
- Harness connectors M72, F102
- Harness for open or short between ECM and ASCD brake switch

>> Repair open circuit or short to ground or short to power in harness or connectors.

7. CHECK ASCD BRAKE SWITCH

Refer to EC-525, "Component Inspection"

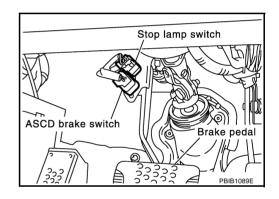

OK or NG

OK >> GO TO 13.

NG >> Replace ASCD brake switch.

8. CHECK STOP LAMP SWITCH POWER SUPPLY CIRCUIT

- 1. Turn ignition switch OFF.
- 2. Disconnect stop lamp switch harness connector.

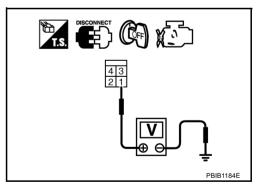

3. Check voltage between stop lamp switch terminal 1 and ground with CONSULT -II or tester.

Voltage: Battery voltage

OK or NG

OK	>> GO TO 10.
NG	>> GO TO 9.

9. DETECT MALFUNCTIONING PART

Check the following.

- Fuse block (J/B) connector E101
- 10A fuse
- Harness for open or short between stop lamp switch and fuse

>> Repair open circuit or short to ground or short to power in harness or connectors.

DTC P1572 ASCD BRAKE SWITCH

10. CHECK STOP LAMP SWITCH INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT	
 Disconnect ECM harness connector. Check harness continuity between ECM terminal 101 and stop lamp switch terminal 2. Refer to Wiring Diagram. 	EC

If NG, adjust stop lamp switch installation, refer to BR-6, "BRAKE PEDAL", and perform step 3 again.

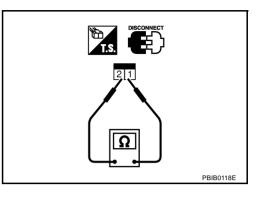

STOP LAMP SWITCH (FOR M/T MODELS)

- 1. Turn ignition switch OFF.
- 2. Disconnect stop lamp switch harness connector.
- 3. Check harness continuity between stop lamp switch terminals 1 and 2 under the following conditions.

Condition	Continuity
When brake pedal is fully released.	Should not exist.
When brake pedal is depressed.	Should exist.

If NG, adjust stop lamp switch installation, refer to <u>BR-6,</u> <u>"BRAKE PEDAL"</u>, and perform step 3 again.

DTC P1574 ASCD VEHICLE SPEED SENSOR

DTC P1574 ASCD VEHICLE SPEED SENSOR

Component Description

The ECM receives two vehicle speed sensor signals via CAN communication line. One is sent from unified meter and A/C amp., and the other is from TCM (Transmission control module). The ECM uses these signals for ASCD control. Refer to EC-638, "AUTOMATIC SPEED CONTROL DEVICE (ASCD)" for ASCD functions.

On Board Diagnosis Logic

This self-diagnosis has the one trip detection logic.

The MIL will not light up for this diagnosis.

NOTE:

- If DTC P1574 is displayed with DTC U1000, U1001, first perform the trouble diagnosis for DTC U1000, U1001. Refer to EC-136, "DTC U1000, U1001 CAN COMMUNICATION LINE".
- If DTC P1574 is displayed with DTC P0500, first perform the trouble diagnosis for DTC P0500. Refer to EC-383, "DTC P0500 VSS"
- If DTC P1574 is displayed with DTC P0605, first perform the trouble diagnosis for DTC P0605. Refer to EC-394, "DTC P0605 ECM"

DTC No.	Trouble Diagnosis Name	DTC Detecting Condition	Possible Cause	- r
			 Harness or connectors (The CAN communication line is open or shorted.) 	0
P1574 1574	ASCD vehicle speed sensor	ECM detects a difference between two vehicle speed signals is out of the specified range.	 Unified meter and A/C amp. ABS actuator and electric unit (control unit) Wheel sensor 	ŀ
			• TCM • ECM	

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

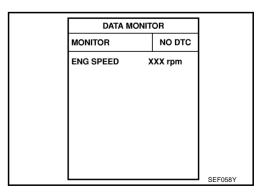

Κ If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

Step 3 may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test T. is expected to be easier, it is unnecessary to lift the vehicle.

WITH CONSULT-II

- 1. Start engine (TCS switch OFF).
- Select "DATA MONITOR" mode with CONSULT-II. 2.
- 3. Drive the vehicle at more than 40 km/h (25 MPH).
- If DTC is detected, go to EC-528, "Diagnostic Procedure". 4.

WITH GST

Follow the procedure "WITH CONSULT-II" above.

OK >> GO TO 3.

NG >> Repair or replace.

3. CHECK DTC WITH UNIFIED METER AND A/C AMP.

Refer to DI-4, "COMBINATION METERS" .

>> INSPECTION END

DTC P1706 PNP SWITCH

Component Description

When the gear position is P or N (A/T), Neutral (M/T), park/neutral position (PNP) switch is ON. ECM detects the position because the continuity of the line (the ON signal) exists.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION	
P/N POSI SW	 Ignition switch: ON 	Shift lever: P or N (A/T), Neutral (M/T)	ON	
1/11/00/00	• Ignition switch. ON	Shift lever: Except above	OFF	D

On Board Diagnosis Logic

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1706 1706	Park/neutral position switch	The signal of the park/neutral position (PNP) switch is not changed in the process of engine starting and driving.	 Harness or connectors [The park/neutral position (PNP) switch circuit is open or shorted.] Park/neutral position (PNP) switch Unified meter and A/C amp. (A/T mod- els) TCM (A/T models)

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

B WITH CONSULT-II

- 1. Turn ignition switch ON.
- Select "P/N POSI SW" in "DATA MONITOR" mode with CON-SULT-II. Then check the "P/N POSI SW" signal under the following conditions.

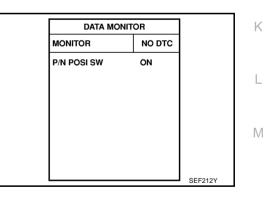

Position (Selector lever)	Known-good signal
N or P position (A/T) Neutral position (M/T)	ON
Except the above position	OFF

If NG, go to $\underline{\text{EC-534}}$, "Diagnostic Procedure" . If OK, go to following step.

- 3. Select "DATA MONITOR" mode with CONSULT-II.
- 4. Start engine and warm it up to normal operating temperature.
- 5. Maintain the following conditions for at least 60 consecutive seconds.

ENG SPEED	1,400 - 6375 rpm
COOLAN TEMP/S	More than 70°C (158°F)
B/FUEL SCHDL	2.0 - 31.8 msec
VHCL SPEED SE	More than 64 km/h (40 MPH)
Selector lever	Suitable position

6. If 1st trip DTC is detected, go to EC-534, "Diagnostic Procedure"

DATA MON	IITOR
MONITOR	NO DTC
ENG SPEED	XXX rpm
COOLAN TEMP/S	XXX °C
VHCL SPEED SE	XXX km/h
P/N POSI SW	OFF

Refer to EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT".

>> INSPECTION END

DTC P1805 BRAKE SWITCH

Description

Brake switch signal is applied to the ECM through the stop lamp switch when the brake pedal is depressed. This signal is used mainly to decrease the engine speed when the vehicle is driving.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CON	IDITION	SPECIFICATION	
BRAKE SW	 Ignition switch: ON 	Brake pedal: Fully released	OFF	
BRARE SW	• Ignition switch. ON	Brake pedal: Slightly depressed	ON	

On Board Diagnosis Logic

The MIL will not light up for this diagnosis.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P1805 1805	Brake switch	A brake switch signal is not sent to ECM for extremely long time while the vehicle is driving.	 Harness or connectors (Stop lamp switch circuit is open or shorted.) 	F
			 Stop lamp switch 	G

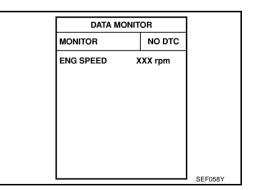

FALI-SAFE MODE

When the malfunction is detected, the ECM enters fail-safe mode.

Engine operating condition in fail-safe mode ECM controls the electric throttle control actuator by regulating the throttle opening to a small range. Therefore, acceleration will be poor. Vehicle condition Driving condition When engine is idling Normal 1 When accelerating Poor acceleration

DTC Confirmation Procedure (I) WITH CONSULT-II

- 1. Turn ignition switch ON.
- 2. Fully depress the brake pedal for at least 5 seconds.
- 3. Erase the DTC with CONSULT-II.
- Select "DATA MONITOR" mode with CONSULT-II. 4.
- 5. If 1st trip DTC is detected, go to EC-539, "Diagnostic Procedure"

WITH GST

Follow the procedure "WITH CONSULT-II" above.

DTC P2122, P2123 APP SENSOR

Component Description

The accelerator pedal position sensor is installed on the upper end of the accelerator pedal assembly. The sensor detects the accelerator position and sends a signal to the ECM.

Accelerator pedal position sensor has two sensors. These sensors are a kind of potentiometers which transform the accelerator pedal position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the accelerator pedal and feed the voltage signals to the ECM. The ECM judges the current opening angle of the accelerator pedal from these signals and controls the throttle control motor based on these signals.

Idle position of the accelerator pedal is determined by the ECM

receiving the signal from the accelerator pedal position sensor. The ECM uses this signal for the engine operation such as fuel cut.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

DTC P2138 APP SENSOR

Component Description

The accelerator pedal position sensor is installed on the upper end of the accelerator pedal assembly. The sensor detects the accelerator position and sends a signal to the ECM.

Accelerator pedal position sensor has two sensors. These sensors are a kind of potentiometers which transform the accelerator pedal position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the accelerator pedal and feed the voltage signals to the ECM. The ECM judges the current opening angle of the accelerator pedal from these signals and controls the throttle control motor based on these signals.

Idle position of the accelerator pedal is determined by the ECM

receiving the signal from the accelerator pedal position sensor. The ECM uses this signal for the engine operation such as fuel cut.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	TEM CONDITION		SPECIFICATION
ACCEL SEN1	Ignition switch: ON	Accelerator pedal: Fully released	0.5 - 1.0V
ACCEL SENT	(Engine stopped)	Accelerator pedal: Fully depressed	4.0 - 4.8V
ACCEL SEN2*	Ignition switch: ON	Accelerator pedal: Fully released	0.3 - 1.2V
ACCEL SENZ	(Engine stopped)	Accelerator pedal: Fully depressed	3.9 - 4.8V
CLSD THL POS	Ignition switch: ON	Accelerator pedal: Fully released	ON
CLOD THE POS	(Engine stopped)	Accelerator pedal: Slightly depressed	OFF

*: Accelerator pedal position sensor 2 signal is converted by ECM internally. Thus, it differ from ECM terminal voltage.

On Board Diagnosis Logic

This self-diagnosis has the one trip detection logic. NOTE:

If DTC P2138 is displayed with DTC P1229, first perform the trouble diagnosis for DTC P1229. Refer to EC-483.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P2138 2138	Accelerator pedal posi- tion sensor circuit range/performance problem	Rationally incorrect voltage is sent to ECM compared with the signals from APP sensor 1 and APP sensor 2.	 Harness or connector (APP sensor 1 and 2 circuit is open or shorted.) (TP sensor circuit is shorted.) Accelerator pedal position sensor (APP sensor 1 and 2) Electric throttle control actuator (TP sensor 1 and 2)

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operating condition in fail-safe mode

The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 dearees.

The ECM regulates the opening speed of the throttle valve to be slower than the normal condition.

So, the acceleration will be poor.

pedal position 6.0 Accelerator pedal posi sensor output voltage Sensor 1 4.0 2.0 Sensor 2 Release -Depress Accelerator pedal operation

DTC Confirmation Procedure

NOTE:

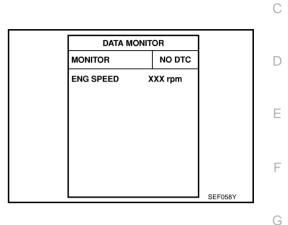

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 10V at idle.

(I) WITH CONSULT-II

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-II.
- 3. Start engine and let it idle for 1 second.
- 4. If DTC is detected, go to EC-567, "Diagnostic Procedure" .

WITH GST

Follow the procedure "WITH CONSULT-II" above.

INJECTOR CIRCUIT

Component Description

The fuel injector is a small, precise solenoid valve. When the ECM supplies a ground to the injector circuit, the coil in the injector is energized. The energized coil pulls the needle valve back and allows fuel to flow through the injector into the intake manifold. The amount of fuel injected depends upon the injection pulse duration. Pulse duration is the length of time the injector remains open. The ECM controls the injection pulse duration based on engine fuel needs.

FUEL PUMP CIRCUIT

FUEL PUMP CIRCUIT

Description SYSTEM DESCRIPTION

Sensor	Input Signal to ECM	ECM Function	Actuator		
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed*	Fuel pump control	Fuel pump relay		
Battery	Battery voltage*				

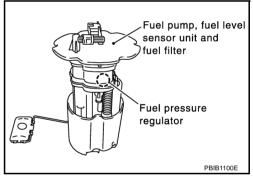

*: ECM determines the start signal status by the signals of engine speed and battery voltage.

The ECM activates the fuel pump for several seconds after the ignition switch is turned on to improve engine startability. If the ECM receives a engine speed signal from the camshaft position sensor (PHASE), it knows that the engine is rotating, and causes the pump to operate. If the engine speed signal is not received when the ignition switch is ON, the engine stalls. The ECM stops pump operation and prevents battery discharging, thereby improving safety. The ECM does not directly drive the fuel pump. It controls the ON/OFF fuel pump relay, which in turn controls the fuel pump.

Condition	Fuel pump operation	
Ignition switch is turned to ON.	Operates for 1 second.	
Engine running and cranking	Operates.	
When engine is stopped	Stops in 1.5 seconds.	
Except as shown above	Stops.	

COMPONENT DESCRIPTION

A turbine type design fuel pump is used in the fuel tank.

- 2. Disconnect ECM harness connector.
- 3. Turn ignition switch ON.
- 4. Check voltage between ECM terminal 113 and ground with CONSULT-II or tester.

Voltage: Battery voltage

OK or NG

OK >> GO TO 5. NG >> GO TO 3.

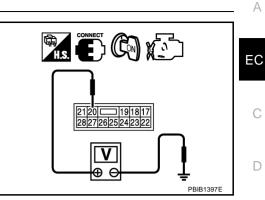

3. CHECK FUEL PUMP POWER SUPPLY CIRCUIT-I

Check voltage between IPDM E/R terminal 20 and ground with CONSULT-II or tester.

Voltage: Battery voltage

OK or NG

OK >> GO TO 4. NG >> GO TO 15.

F

F

Н

4. DETECT MALFUNCTIONING PART

Check the following.

- Harness connectors E108, M15
- Harness connectors M72, F102
- Harness for open or short between IPDM E/R and ECM

>> Repair harness or connectors.

5. CHECK CONDENSER POWER SUPPLY CIRCUIT-I

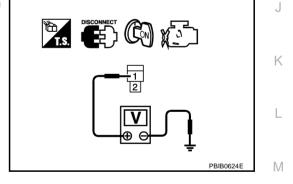

- 1. Turn ignition switch OFF.
- 2. Reconnect all harness connectors disconnected.
- 3. Disconnect condenser harness connector.
- 4. Turn ignition switch ON.
- 5. Check voltage between condenser terminal 1 and ground with CONSULT-II or tester.

Voltage: Battery voltage should exist for 1 second after ignition switch is turned ON.

6. Also check harness for short to ground and short to power.

OK or NG

OK >> GO TO 9. NG >> GO TO 6.

6. CHECK 15A FUSE

- 1. Turn ignition switch OFF.
- 2. Disconnect 15A fuse.
- 3. Check 15A fuse.

OK or NG

OK >> GO TO 7. NG >> Replace fuse.

7. CHECK CONDENSER POWER SUPPLY CIRCUIT-II

- 1. Disconnect IPDM E/R harness connector E7.
- 2. Check harness continuity between IPDM E/R terminal 23 and condenser terminal 1. Refer to Wiring Diagram.

Continuity should exist.

3. Also check harness for short to ground and short to power.

OK or NG

OK >> GO TO 15. NG >> GO TO 8.

8. DETECT MALFUNCTIONING PART

Check the following.

- Harness connectors E107, B3
- Harness for open or short between IPDM E/R and condenser

>> Repair harness or connectors.

9. CHECK CONDENSER GROUND CIRCUIT

1. Check harness continuity between condenser terminal 2 and ground. Refer to Wiring Diagram.

Continuity should exist.

2. Also check harness for short to power.

OK or NG

OK >> GO TO 11. NG >> GO TO 10

10. DETECT MALFUNCTIONING PART

Check the following.

- Harness connectors B61, T23
- Harness for open or short between condenser and ground

>> Repair open circuit or short to power in harness or connectors.

11. CHECK CONDENSER

Refer to EC-595, "Component Inspection" .

OK or NG

OK >> GO TO 12.

NG >> Replace condenser.

12. CHECK FUEL PUMP POWER SUPPLY AND GROUND CIRCUIT FOR OPEN AND SHORT

- 1. Turn ignition switch OFF.
- 2. Disconnect "fuel level sensor unit and fuel pump" harness connector.
- Check harness continuity between "fuel level sensor unit and fuel pump" terminal 1 and harness connector B3 terminal 4, "fuel level sensor unit and fuel pump" terminal 3 and ground. Refer to Wiring Diagram.

Continuity should exist.

4. Also check harness for short to ground and short to power.

OK or NG

OK >> GO TO 14. NG >> GO TO 13.

13. DETECT MALFUNCTIONING PART

Check the following.

- Harness connector B3
- Harness connectors B61, T23
- Harness for open or short between fuel pump and harness connector B3
- Harness for open or short between fuel pump and ground

>> Repair open circuit or short to power in harness or connectors.

14. CHECK FUEL PUMP

Refer to EC-595, "Component Inspection" .

OK or NG

OK >> GO TO 15.

NG >> Replace fuel pump.

15. CHECK INTERMITTENT INCIDENT

Refer to EC-128, "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT" .

OK or NG

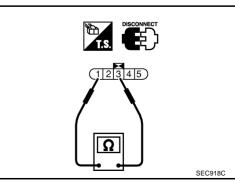

OK >> Replace IPDM E/R.

NG >> Repair or replace harness or connectors.

Component Inspection FUEL PUMP

- 1. Disconnect fuel level sensor unit and fuel pump harness connector.
- 2. Check resistance between fuel level sensor unit and fuel pump terminals 1 and 3.

Resistance: 0.2 - 5.0Ω [at 25°C (77°F)]

CONDENSER

1. Turn ignition switch OFF.

REFRIGERANT PRESSURE SENSOR

Component Description

The refrigerant pressure sensor is installed at the condenser of the air conditioner system. The sensor uses an electrostatic volume pressure transducer to convert refrigerant pressure to voltage. The voltage signal is sent to ECM, and ECM controls cooling fan system.

ELECTRICAL LOAD SIGNAL

Description

The electrical load signal (Headlamp switch signal, rear window defogger switch signal, etc.) is transferred through the CAN communication line from BCM to ECM via IPDM E/R.

CONSULT-II Reference Value in Data Monitor Mode

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
LOAD SIGNAL	 Ignition switch: ON 	Rear window defogger switch is ON and/or lighting switch is in 2nd.	ON
		Rear window defogger switch is OFF and lighting switch is OFF.	OFF

Diagnostic Procedure

1. CHECK LOAD SIGNAL CIRCUIT OVERALL FUNCTION-I

- Turn ignition switch ON. 1.
- 2. Connect CONSULT-II and select "DATA MONITOR" mode.
- 3. Select "LOAD SIGNAL" and check indication under the following conditions.

Condition	Indication
Rear window defogger switch ON	ON
Rear window defogger switch OFF	OFF

OK or NG

ASCD INDICATOR

ASCD INDICATOR

Component Description

ASCD indicator lamp illuminates to indicate ASCD operation status. Lamp has two indicators, CRUISE and SET, and is integrated in combination meter.

CRUISE indicator illuminates when CRUISE switch on ASCD steering switch is turned ON to indicated that ASCD system is ready for operation.

SET indicator illuminates when following conditions are met.

- CRUISE indicator is illuminated.
- SET switch on ASCD steering switch is turned ON while vehicle speed is within the range of ASCD setting.

SET indicator remains lit during ASCD control. Refer to <u>EC-638, "AUTOMATIC SPEED CONTROL DEVICE (ASCD)"</u> for the ASCD function.

EVAPORATIVE EMISSION SYSTEM

EVAPORATIVE EMISSION SYSTEM

PFP:14950

ABS0016R

Description SYSTEM DESCRIPTION

The evaporative emission system is used to reduce hydrocarbons emitted into the atmosphere from the fuel system. This reduction of hydrocarbons is accomplished by activated charcoals in the EVAP canister.

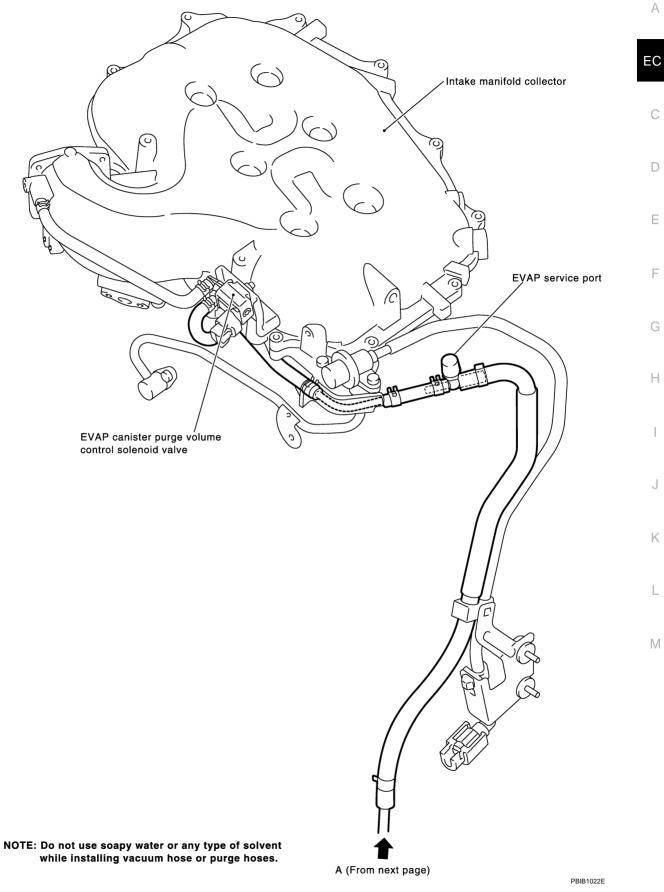

The fuel vapor in the sealed fuel tank is led into the EVAP canister which contains activated carbon and the vapor is stored there when the engine is not operating or when refueling to the fuel tank.

The vapor in the EVAP canister is purged by the air through the purge line to the intake manifold when the engine is operating. EVAP canister purge volume control solenoid valve is controlled by ECM. When the engine operates, the flow rate of vapor controlled by EVAP canister purge volume control solenoid valve is proportionally regulated as the air flow increases.

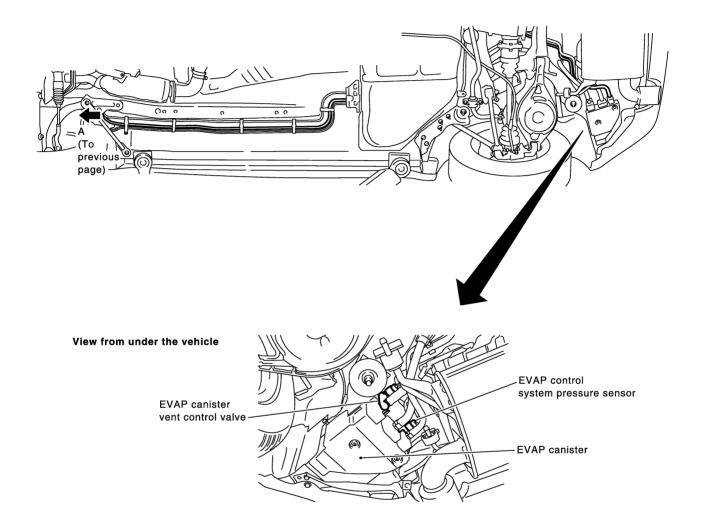

EVAP canister purge volume control solenoid valve also shuts off the vapor purge line during decelerating and idling.

EVAPORATIVE EMISSION SYSTEM

EVAPORATIVE EMISSION LINE DRAWING

EC-625

Component Inspection EVAP CANISTER

Check EVAP canister as follows:

- Block port B. 1
- Blow air into port A and check that it flows freely out of port C. 2.
- 3. Release blocked port B.
- 4. Apply vacuum pressure to port **B** and check that vacuum pressure exists at the ports A and C.
- 5. Block port A and B.
- 6. Apply pressure to port **C** and check that there is no leakage.

FUEL TANK VACUUM RELIEF VALVE (BUILT INTO FUEL FULLER CAP)

1. Wipe clean valve housing.

Pressure:	15.3 - 20.0 kPa (0.156 - 0.204 kg/cm ² , 2.22 - 2.90 psi)
Vacuum:	-6.0 to −3.3 kPa (−0.061 to −0.034 kg/cm ² , −0.87 to −0.48 psi)

3. If out of specification, replace fuel filler cap as an assembly.

CAUTION:

Use only a genuine fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.

EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Refer to EC-333 .

FUEL TANK TEMPERATURE SENSOR

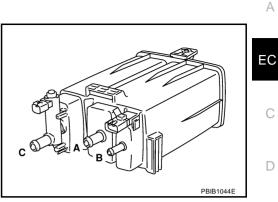

Refer to EC-275.

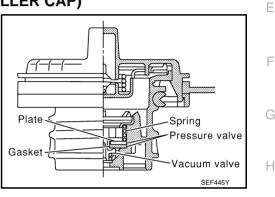

EVAP CANISTER VENT CONTROL VALVE

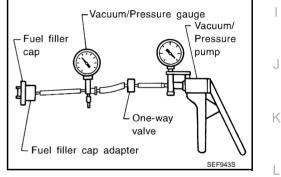

Refer to EC-340.

EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-350.

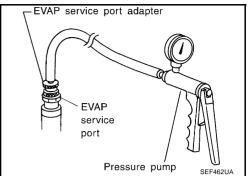

F

EVAP SERVICE PORT

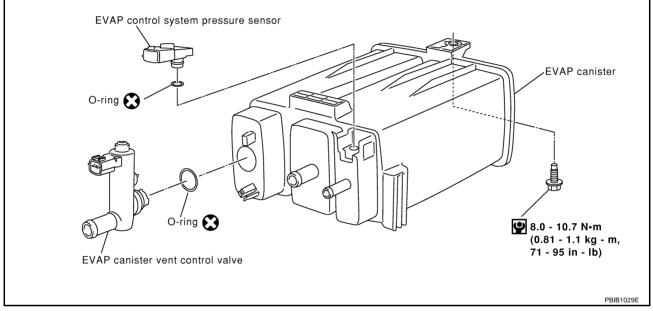

Positive pressure is delivered to the EVAP system through the EVAP service port. If fuel vapor leakage in the EVAP system occurs, use a leak detector to locate the leak.

ABS0016T

Removal and Installation EVAP CANISTER

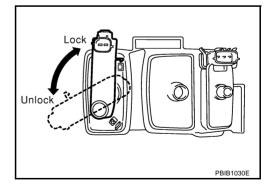

Tighten EVAP canister as shown in the figure.

EVAP CANISTER VENT CONTROL VALVE

- 1. Turn EVAP canister vent control valve counterclockwise.
- 2. Remove the EVAP canister vent control valve.

Do not reuse the O-ring, replace it with a new one.

How to Detect Fuel Vapor Leakage

CAUTION:

• Never use compressed air or a high pressure pump.

• Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in EVAP system.

- NOTE:
- Do not start engine.
- Improper installation of EVAP service port adapter to the EVAP service port may cause a leak.

ABS0016U

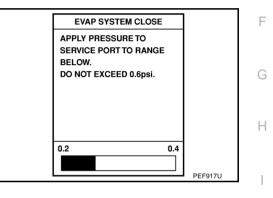

EVAPORATIVE EMISSION SYSTEM

WITH CONSULT-II

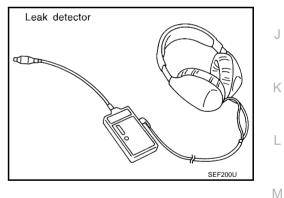

- 1. Attach the EVAP service port adapter securely to the EVAP service port.
- 2. Also attach the pressure pump and hose to the EVAP service port adapter.
- 3. Turn ignition switch ON.
- 4. Select the "EVAP SYSTEM CLOSE" of "WORK SUPPORT MODE" with CONSULT-II.
- 5. Touch "START". A bar graph (Pressure indicating display) will appear on the screen.

		EC
EVAP SYSTEM CLOSE		
APPLY PRESSURE TO EVAP SYSTEM FROM SERVICE PORT USING HAND PUMP WITH PRESSURE GAUGE AT		С
NEXT SCREEN. NEVER USE COMPRESSED AIR OR HIGH PRESSURE PUMP!		D
DO NOT START ENGINE. TOUCH START.	PEF838U	E

- 6. Apply positive pressure to the EVAP system until the pressure indicator reaches the middle of the bar graph.
- 7. Remove EVAP service port adapter and hose with pressure pump.

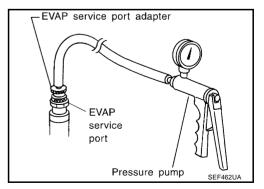

8. Locate the leak using a leak detector. Refer to <u>EC-625, "EVAP-ORATIVE EMISSION LINE DRAWING"</u>.

WITHOUT CONSULT-II

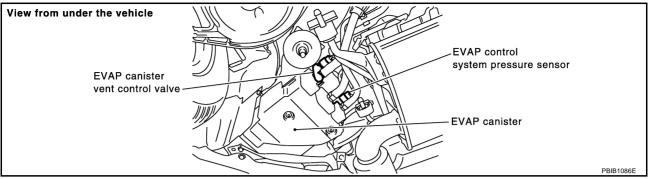

- 1. Attach the EVAP service port adapter securely to the EVAP service port.
- 2. Also attach the pressure pump with pressure gauge to the EVAP service port adapter.

А

EVAPORATIVE EMISSION SYSTEM

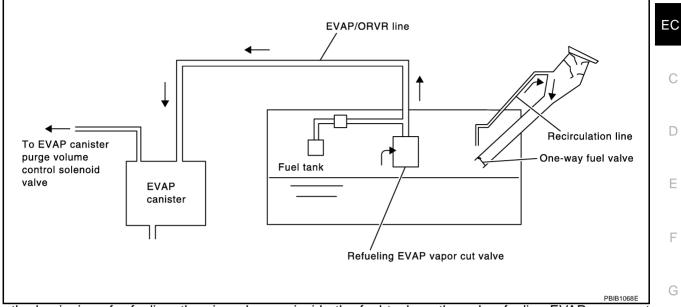

3. Apply battery voltage to between the terminals of EVAP canister vent control valve to make a closed EVAP system.

- 4. To locate the leak, deliver positive pressure to the EVAP system until pressure gauge points reach 1.38 to 2.76 kPa (0.014 to 0.028 kg/cm², 0.2 to 0.4 psi).
- 5. Remove EVAP service port adapter and hose with pressure pump.
- 6. Locate the leak using a leak detector. Refer to EC-625, "EVAPORATIVE EMISSION LINE DRAWING" .

ON BOARD REFUELING VAPOR RECOVERY (ORVR)

System Description

From the beginning of refueling, the air and vapor inside the fuel tank go through refueling EVAP vapor cut valve and EVAP/ORVR line to the EVAP canister. The vapor is absorbed by the EVAP canister and the air is released to the atmosphere.

When the refueling has reached the full level of the fuel tank, the refueling EVAP vapor cut valve is closed and refueling is stopped because of auto shut-off. The vapor which was absorbed by the EVAP canister is purged during driving.

WARNING:

When conducting inspections below, be sure to observe the following:

- Put a "CAUTION: INFLAMMABLE" sign in workshop.
- Do not smoke while servicing fuel system. Keep open flames and sparks away from work area.
- Be sure to furnish the workshop with a CO₂ fire extinguisher.

CAUTION:

- Before removing fuel line parts, carry out the following procedures:
- Put drained fuel in an explosion-proof container and put lid on securely.
- Release fuel pressure from fuel line. Refer to EC-44, "FUEL PRESSURE RELEASE".
- Disconnect battery ground cable.
- Always replace O-ring when the fuel gauge retainer is removed.
- Do not kink or twist hose and tube when they are installed.
- Do not tighten hose and clamps excessively to avoid damaging hoses.
- After installation, run engine and check for fuel leaks at connection.
- Do not attempt to top off the fuel tank after the fuel pump nozzle shuts off automatically. Continued refueling may cause fuel overflow, resulting in fuel spray and possibly a fire.

Diagnostic Procedure SYMPTOM: FUEL ODOR FROM EVAP CANISTER IS STRONG.

ABS0016W

1. CHECK EVAP CANISTER

- 1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
- 2. Weigh the EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.

The weight should be less than 2.2 kg (4.9 lb).

OK or NG

OK >> GO TO 2. NG >> GO TO 3.

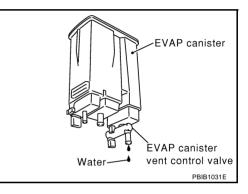

NG >> GO TO 3.

2. CHECK IF EVAP CANISTER SATURATED WITH WATER

Does water drain from the EVAP canister?

Yes or No

Yes >> GO TO 3. No >> GO TO 5.

3. REPLACE EVAP CANISTER

Replace EVAP canister with a new one.

>> GO TO 4.

4. DETECT MALFUNCTIONING PART

Check the EVAP hose between EVAP canister and vehicle frame for clogging or poor connection.

>> Repair or replace EVAP hose.

5. CHECK REFUELING EVAP VAPOR CUT VALVE

Refer to EC-634, "Component Inspection" .

OK or NG

- OK >> INSPECTION END
- NG >> Replace refueling EVAP vapor cut valve with fuel tank.

SYMPTOM: CANNOT REFUEL/FUEL ODOR FROM THE FUEL FILLER OPENING IS STRONG WHILE REFUELING.

1. CHECK EVAP CANISTER

- 1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor EC attached.
- 2. Weigh the EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.

The weight should be less than 2.2 kg (4.9 lb).

4. DETECT MALFUNCTIONING PART

Check the EVAP hose between EVAP canister and vehicle frame for clogging or poor connection.

>> Repair or replace EVAP hose.

5. CHECK VENT HOSES AND VENT TUBES

Check hoses and tubes between EVAP canister and refueling control valve for clogging, kink, looseness and improper connection.

OK or NG

OK >> GO TO 6.

NG >> Repair or replace hoses and tubes.

6. CHECK FILLER NECK TUBE

Check recirculation line for clogging, dents and cracks.

OK or NG

OK >> GO TO 7. NG >> Replace filler neck tube.

Revision: 2004 November

7. CHECK REFUELING EVAP VAPOR CUT VALVE

Refer to EC-634, "Component Inspection" .

OK or NG

OK >> GO TO 8.

NG >> Replace refueling EVAP vapor cut valve with fuel tank.

8. CHECK FUEL FILLER TUBE

Check filler neck tube and hose connected to the fuel tank for clogging, dents and cracks.

OK or NG

OK >> GO TO 9.

NG >> Replace fuel filler tube.

9. CHECK ONE-WAY FUEL VALVE-I

Check one-way valve for clogging.

OK or NG

OK >> GO TO 10.

NG >> Repair or replace one-way fuel valve with fuel tank.

10. CHECK ONE-WAY FUEL VALVE-II

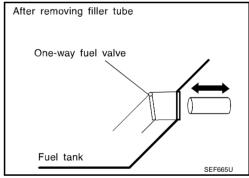

- 1. Make sure that fuel is drained from the tank.
- 2. Remove fuel filler tube and hose.
- 3. Check one-way fuel valve for operation as follows. When a stick is inserted, the valve should open, when removing stick it should close.

Do not drop any material into the tank.

OK or NG

OK >> INSPECTION END

NG >> Replace fuel filler tube or replace one-way fuel valve with fuel tank.

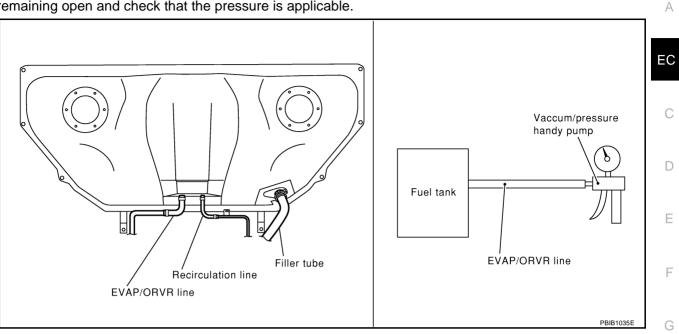

ABS0016X

Component Inspection REFUELING EVAP VAPOR CUT VALVE

With CONSULT-II

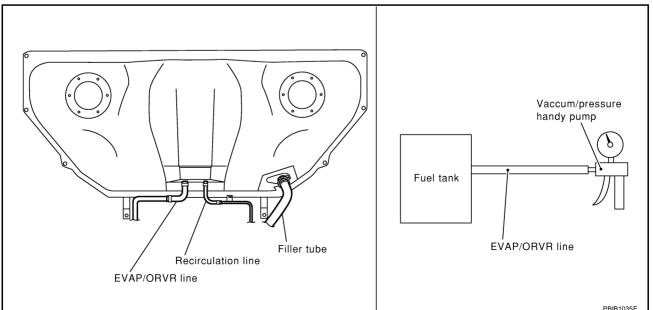

- 1. Remove fuel tank. Refer to FL-11, "FUEL TANK" .
- 2. Drain fuel from the tank as follows:
- a. Remove fuel feed hose located on the fuel gauge retainer.
- b. Connect a spare fuel hose, one side to fuel gauge retainer where the hose was removed and the other side to a fuel container.
- c. Drain fuel using "FUEL PUMP RELAY" in "ACTIVE TEST" mode with CONSULT-II.
- Check refueling EVAP vapor cut valve for being stuck to close as follows. Blow air into the refueling EVAP vapor cut valve (from the end of EVAP/ORVR line hose), and check that the air flows freely into the tank.
- 4. Check refueling EVAP vapor cut valve for being stuck to open as follows.
- a. Connect vacuum pump to hose end.
- b. Remove fuel gauge retainer with fuel gauge unit. Always replace O-ring with new one.
- c. Put fuel tank upside down.

d. Apply vacuum pressure to hose end [-13.3 kPa (-100 mmHg, -3.94 inHg)] with fuel gauge retainer remaining open and check that the pressure is applicable.

Without CONSULT-II

- 1. Remove fuel tank. Refer to FL-11, "FUEL TANK" .
- 2. Drain fuel from the tank as follows:
- a. Remove fuel gauge retainer.
- b. Drain fuel from the tank using a handy pump into a fuel container.
- 3. Check refueling EVAP vapor cut valve for being stuck to close as follows. Blow air into the refueling EVAP vapor cut valve (from the end of EVAP/ORVR line hose), and check that the air flows freely into the tank.
- 4. Check refueling EVAP vapor cut valve for being stuck to open as follows.
- a. Connect vacuum pump to hose end.
- b. Remove fuel gauge retainer with fuel gauge unit. Always replace O-ring with new one.
- c. Put fuel tank upside down.
- d. Apply vacuum pressure to hose end [-13.3 kPa (-100 mmHg, -3.94 inHg)] with fuel gauge retainer remaining open and check that the pressure is applicable.

control actuator

Description SYSTEM DESCRIPTION

PCV valve

ABS0016Z

3

Normal condition

On vehicles with an excessively high blow-by, the valve does not meet the requirement. This is because some of the flow will go through the hose connection to the air inlet tubes under all conditions.

This system returns blow-by gas to the intake manifold.

The positive crankcase ventilation (PCV) valve is provided to conduct crankcase blow-by gas to the intake manifold. During partial throttle operation of the engine, the intake manifold sucks the blow-by gas through the PCV valve. Normally, the capacity of the valve is sufficient to handle any blow-by and a small amount of ventilating air. The ventilating air is then drawn from the air inlet tubes into the crankcase. In this process the air passes through the hose connecting air inlet tubes to rocker cover. Under full-throttle condition, the manifold vacuum is insufficient to draw the blow-by flow through the valve. The flow goes through the hose connection in the reverse direction.

AUTOMATIC SPEED CONTROL DEVICE (ASCD)

AUTOMATIC SPEED CONTROL DEVICE (ASCD)

System Description INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
ASCD brake switch	Brake pedal operation		
Stop lamp switch	Brake pedal operation		
ASCD clutch switch	Clutch pedal operation		
ASCD steering switch	ASCD steering switch operation	ASCD vehicle speed control	Electric throttle control
Park/Neutral position (PNP) switch	Gear position		actuator
Unified meter and A/C amp.*	Vehicle speed		
TCM*	Powertrain revolution		

*: This signal is sent to the ECM through CAN communication line.

BASIC ASCD SYSTEM

Refer to Owner's Manual for ASCD operating instructions.

Automatic Speed Control Device (ASCD) allows a driver to keep vehicle at predetermined constant speed without depressing accelerator pedal. Driver can set vehicle speed in advance between approximately 40 km/ h (25 MPH) and 144 km/h (89 MPH).

ECM controls throttle angle of electric throttle control actuator to regulate engine speed.

Operation status of ASCD is indicated by CRUISE indicator and SET indicator in combination meter. If any malfunction occurs in ASCD system, it automatically deactivates control.

NOTE:

Always drive vehicle in safe manner according to traffic conditions and obey all traffic laws.

SET OPERATION

Press ASCD CRUISE switch (Main switch). (The CRUISE indicator in combination meter illuminates.) When vehicle speed reaches a desired speed between approximately 40 km/h (25 MPH) and 144 km/h (89 MPH), press SET switch. (Then SET indicator in combination meter illuminates.)

ACCEL OPERATION

If the RESUME/ACCEL switch is pressed during cruise control driving, increase the vehicle speed until the switch is released or vehicle speed reaches maximum speed controlled by the system. And then ASCD will keep the new set speed.

CANCEL OPERATION

When any of following conditions exist, cruise operation will be canceled.

- CANCEL switch is pressed
- More than 2 switches at ASCD steering switch are pressed at the same time (Set speed will be cleared)
- Brake pedal is depressed
- Clutch pedal is depressed or gear position is changed to the neutral position (M/T models)
- Selector lever is changed to N, P, R position (A/T models)
- Vehicle speed decreased to 13 km/h (8 MPH) lower than the set speed
- TCS system is operated

When the ECM detects any of the following conditions, the ECM will cancel the cruise operation and inform the driver by blinking indicator lamp.

 Engine coolant temperature is slightly higher than the normal operating temperature, CRUISE lamp may blink slowly.

When the engine coolant temperature decreases to the normal operating temperature, CRUISE lamp will stop blinking and the cruise operation will be able to work by pressing SET switch or RESUME switch.

• Malfunction for some self-diagnoses regarding ASCD control: SET lamp will blink quickly.

If MAIN switch is turned to OFF during ASCD is activated, all of ASCD operations will be canceled and vehicle speed memory will be erased.

PFP:18930

ABS00170

AUTOMATIC SPEED CONTROL DEVICE (ASCD)

COAST OPERATION

When the SET/COAST switch is pressed during cruise control driving, decrease vehicle set speed until the switch is released. And then ASCD will keep the new set speed.

RESUME OPERATION

When the RESUME/ACCEL switch is pressed after cancel operation other than pressing MAIN switch is performed, vehicle speed will return to last set speed. To resume vehicle set speed, vehicle condition must meet following conditions.

- Brake pedal is released
- Clutch pedal is released (M/T models)
- A/T selector lever is in other than P and N positions (A/T models)
- Vehicle speed is greater than 40 km/h (25 MPH) and less than 144 km/h (89 MPH)

Component Description ASCD STEERING SWITCH

Refer to EC-503.
